

TOTAL IONIZING DOSE TEST REPORT (REV1)

RT4G150 – Lot: KRMLM

September 1st 2015

J.J. Wang, Stephen Varela, Harvey Chen, Kevin Chou, Michael Traas

I. SUMMARY TABLE

Parameter	Tolerance
1. Gross Functionality	Passed 125krad(SiO ₂)
2. Power Supply Current	Passed 125krad(SiO ₂)
3. Input Threshold (VTIL/VIH)	Passed 125krad(SiO ₂)
4. Output Drive (VOL/VOH)	Passed 125krad(SiO ₂)
5. Propagation Delay	Passed 125krad(SiO ₂) for 10% degradation criterion
6. Transition Time	Passed 125krad(SiO ₂)

II. TOTAL IONIZING DOSE (TID) TESTING

This testing is designed on the basis of an extensive database of TID testing for Radiation-Tolerant FPGAs including flash-based FPGAs. Microsemi TID reports can be found at <http://www.microsemi.com/products/fpga-soc/radtolerant-fpgas/military-aerospace-radiation-reliability-data#tid-reports>

Electrical parameters are measured pre-irradiation and post-irradiation using the burn in design and the ATE test program. The report summarizes sample pins. Two factors make sampling appropriate: first, the tolerance is determined by current and propagation delays which are global parameters; second the total dose effect is uniformly distributed across the chip.

A. Device-Under-Test (DUT) and Irradiation Parameters

Table 1 lists the DUT and irradiation parameters. During irradiation each input and most of the output is grounded.

Table 1. DUT and Irradiation Parameters

Part Number	RT4G150
Package	LG1657
Foundry	United Microelectronics Corp.
Technology	65 nm
DUT Design	Burn in design with inverter string
Die Lot Number	KRMLM
Quantity Tested	3
Serial Number	4594, 4601, 4649
Radiation Facility	Defense Microelectronics Activity
Radiation Source	Co-60
Dose Rate	5 krad (SiO ₂)/min
Irradiation Temperature	Room
Irradiation and Measurement Bias	Static at 1.2V/2.5V/3.3V/3.3V
IO Configuration	Single ended Differential Pair

B. Test Method

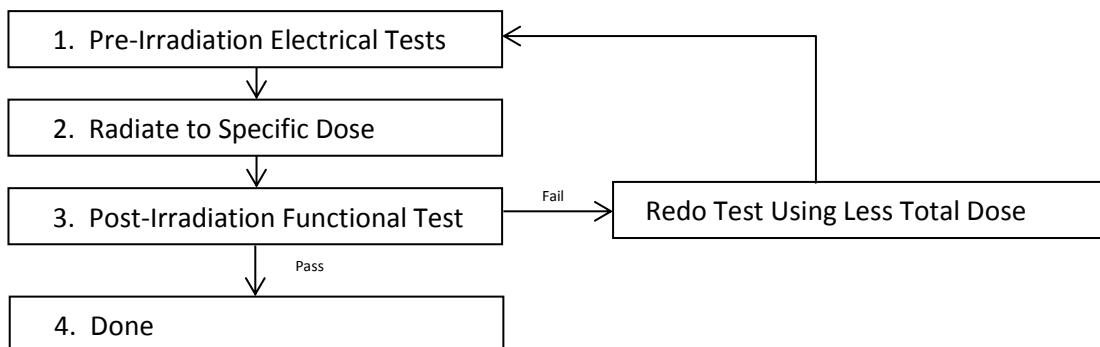

Fig. 1. Parametric test flow chart

The test method generally follows the guidelines in the military standard TM1019. Figure 1 shows the flow chart describing the steps for the functional and parametric tests.

C. Design and Parametric Measurements

RTG4 FPGA devices have different types of I/Os, such as MSIO and MSIOD, double data rate I/Os (DDRIO), and dedicated I/Os based on functional usage. For more information on I/O naming conventions and I/O description, refer to the RTG4 FPGA Pin Description. All I/Os are tested pre and post-irradiation.

Fabric functionality coverage performed by the burn in design is summarized in table 2 below. In addition to the fabric coverage the supplemental test of propagation delay is also used to determine DUT functionality. These tests are performed pre and post-irradiation and recorded as a pass/fail. *Refer to appendix A for a graphical representation of fabric functional coverage blocks used to perform the functional tests.*

Table. 2. Fabric Functional Coverage

Block	Coverage
Combo Block	combinatorial macros available in the RTG4 library
Register Block	sequential macros available in the RTG4 library
UPROM	Maximum output toggle rate(checker board) compared to reference
Embedded SRAM Blocks	full toggle coverage on 209 fabric LSRAM & 210 uRAM blocks using dual port/ two port configurations (x18 width)
Shift Register Block	core utilization
I/O Block	I/O utilization
Math Block	full toggle coverage on 462 fabric math blocks with maximum width configuration

The core power supply current IDD, the I/Os power supply currents (IDDI_2.5/IDDI_3.3) and the charge pump/PLL power supply current (IPP_PLL) are also monitored during irradiation in real time.

The input logic threshold (VIL/VIH) is measured on all single-ended inputs as well as all differential inputs, and is reported as a pass or fail, as part of the ATE test program. The output-drive voltage (VOL/VOH) is also measured on all pins on the MSIO MSIOD and DDRIO. This report contains the output-drive voltage measurements on selected IO pins used in the burn in design are reported at the LVTTL and LVCMS 2.5V standard at different sourcing and sinking currents.

A 2000 stage inverter string is used to measure propagation delay. The propagation delay is defined as the time delay from the triggering edge at the Clock input to the switching edge at the output. The propagation delay is monitored real time during irradiation and the time difference between positive switching edges of the clock and output are reported. Additionally, the transition characteristics (rise and fall) at the output of the inverter chain are measured pre and post-irradiation. Oscilloscope screen captures are shown in section III. F.

III. TEST RESULTS

A. Functionality

Every DUT passed the pre-irradiation and post-irradiation functional tests mentioned in section IIc.

B. Power Supply Current

The core power supply current (IDD) is 1.2 V, the I/O bank power supply currents (IDDI) are 2.5 V (IDDI_2.5) and 3.3 V (IDDI_3.3). The charge pump and PLL power supply current (IPP_PLL) is 3.3 V. Figures 2-12 illustrate the plot of in-flux standby IDD, IDDI_2.5, IDDI_3.3 and IPP_PLL versus total dose for every DUT. Tables 3-6 summarize the pre-irradiation and post-irradiation total current (static & dynamic) IDD, IDDI_2.5, IDDI_3.3 and IPP_PLL. In each case the current measured pre and post irradiation is minimal.

Note that the delta in the current measurements for DUT 4601 is relatively lower in comparison to the other 2 DUTs. This is because the current was not monitored during running time and recorded values are taken after beam stopped. These readings are taken within an hour which is within the testing spec.

C. Single-Ended Input Logic Threshold (VIL/VIH)

The input switching threshold, or trip point, is defined as the applied input voltage at which the output of the design starts to switch. VIH is the input trip point when the input is going high to low and VIL is the input trip point when the input is going low to high. The input logic threshold (VIL/VIH) is measured on all single-ended inputs as well as all differential input and recorded as pass or fail. All I/Os are tested at their respective I/O standards and are compliant to the JEDEC specs. Refer to http://www.microsemi.com/document-portal/doc_view/135193-ds0131-rtg4-fpga-datasheet for more information.

The 3 DUTs tested passed with respect to the testing specification pre and post-irradiation. This pass/fail is determined as part of the ATE test program used to perform pre and post-irradiation electrical parametric measurements.

D. Output-Drive Voltage (VOL/VOH)

The pre-irradiation and post-irradiation output-drive voltages (VOL/VOH) are performed on all available IOs. The measurements performed pre and post irradiation are within the specification limits; in each case, the radiation-induced degradation is within 10%. For the purpose of this report, the measurements presented below are sampled on several pins used in the burn in design. The respective specs for the data provided are also listed in tables 9 through 12. The testing specs comply with the JEDEC spec as aforementioned.

E. Propagation Delay

Table 25 lists pre-irradiation and post irradiation propagation measurements. It shows that the change due to radiation on each DUT is not significant. Note fig 10 exhibits some noise which can be disregarded. The radiation environment is subject to higher noise which occasionally impacts measurements made by testing equipment. The radiation effect of the propagation delay measured on this device is still negligible and comparable with the other devices.

Table 25. Pre-irradiation and Post irradiation Propagation Delay

DUT	Total Dose	Pre-Irradiation (μs)	Post-Irradiation (μs)	Change Degradation (%)
4594	125 krad	0.452	0.451	-0.292
4649	125 krad	0.449	0.445	-0.900
4601	125 krad	0.440	0.439	-0.173

The following figures also show the propagation delay measured during irradiation of the part as a function of TID.

F. Transition Time

Figures show the pre-irradiation and post annealing transitions edges. In each case the radiation induced transition degradation is not observable.
