TOTAL IONIZING DOSE TEST REPORT

No. 12T-RTAX1000S-CQ352-D5G811

August 17, 2012

CK Huang and J.J. Wang

(650) 318-4209, (650) 318-4576

chang-kai.huang@microsemi.com, jih-jong.wang@microsemi.com

I. Summary Table

Parameter	Tolerance
1. Gross Functionality	Passed 300 krad (SiO ₂)
2. Power Supply Current (ICCA/ICCI)	Passed 200 krad (SiO ₂)
3. Input Threshold (VTIL/VIH)	Passed 300 krad (SiO ₂)
4. Output Drive (VOL/VOH)	Passed 300 krad (SiO ₂)
5. Propagation Delay	Passed 300 krad (SiO ₂) for 10% degradation criterion
6. Transition Characteristics	Passed 300 krad (SiO ₂)

II. Total Ionizing Dose (TID) Testing

This testing is designed on the base of an extensive database (see TID data of antifuse-based FPGAs at <http://www.klabs.org> and <http://www.microsemi.com/soc>) accumulated from the TID testing of many generations of antifuse-based FPGAs.

A. Device-Under-Test (DUT) and Irradiation Parameters

Table 1 lists the DUT and irradiation parameters. During irradiation each input and most of the output is grounded through a 100k-ohm resistor; during annealing each input or output is tied to the ground or VCCI with a 2.7 k-ohm resistor. Appendix A contains the schematics of the irradiation-bias circuit.

Table 1 DUT and Irradiation Parameters

Part Number	RTAX1000S
Package	CQFP352
Foundry	United Microelectronics Corp.
Technology	0.15 µm CMOS
DUT Design	TOP_AX1000S_TID
Die Lot Number	D5G811
Quantity Tested	6
Serial Number	300 krad(SiO ₂): 2497, 2520, 2521 200 krad(SiO ₂): 2532, 2543, 2550
Radiation Facility	Defense Microelectronics Activity
Radiation Source	Co-60
Dose Rate ($\pm 5\%$)	7.5 krad(SiO ₂)/min
Irradiation Temperature	Room
Irradiation and Measurement Bias (VCCI/VCCA)	Static at 3.3 V/1.5 V

B. Test Method

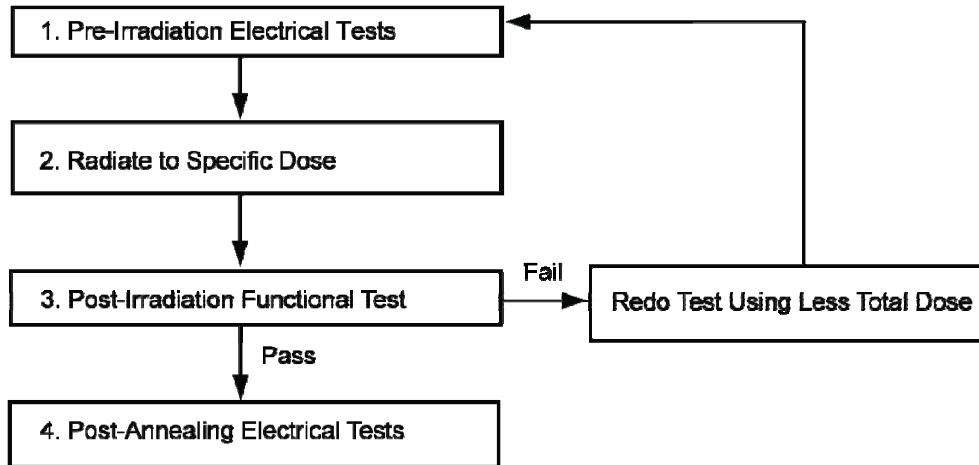

Figure 1 Parametric Test Flow Chart

The test method generally follows the guidelines in the military standard TM1019.8. Figure 1 is the flow chart describing the steps for functional and parametric tests, irradiation, and post-irradiation annealing.

The accelerated aging, or rebound test mentioned in TM1019.8 is unnecessary because there is no adverse time-dependent effect (TDE) in Microsemi products manufactured by deep sub-micron CMOS technologies. Elevated temperature annealing basically reduces the effects originating from radiation-induced leakage currents. As indicated by test data in the following sections, the predominant radiation effects in RTAX1000S are due to radiation-induced leakage currents.

Room temperature annealing is performed in this test; the duration is approximately 7 days.

C. Design and Parametric Measurements

The DUT uses a high utilization, generic design (TOP_AX1000S_TID) to evaluate total dose effects for typical space applications. Appendix B contains the schematics and Verilog files of this design.

Table 2 lists measured electrical parameters and the corresponding logic design. The functionality is measured on the output pin (O_BS) of a combinational buffer-string with 14,000 buffers, output pins (O_ANDP_CLKF, O_ORP_CLKF, O_FF_CLKF, O_ANDC_CLKF, O_ORC_CLKF, O_ANDP_CLKG, O_ORP_CLKG, O_FF_CLKG, O_ANDC_CLKG, O_ORC_CLKG, O_ANDP_CLKH, O_ORP_CLKH, O_FF_CLKH, O_ANDC_CLKH, O_ORC_CLKH, O_ANDP_HCLKA, O_ORP_HCLKA, O_FF_HCLKA, O_ANDC_HCLKA, and O_ORC_HCLKA) of four (4) shift registers with 10,728 bits total, and half of the output pins (OUTX0, OUTX1, OUTX2, OUTX3, OUTX4, OUTX5, OUTX6 and OUTX7) of the embedded RAM configured as 16Kx16.

ICC is measured on the power supply of the logic-array (ICCA) and I/O (ICCI) respectively. The input logic threshold (VIL/VIH) is measured on single-ended inputs EN8, DA, IO_I1, IO_I2, IO_I3, IO_I4, IO_I5 and IO_I6, and also on differential inputs DIO_I1P, DIO_I2P, DIO_I3P, DIO_I4P, DIO_I5P, DIO_I6P and DIO_I7P. The differential inputs are configured as LVPECL instead of LVDS because LVPECL, using 3.3 VDC, is worse than LVDS, which uses 2.5 VDC. During the measurement on the differential inputs, the N (negative) side of the differential pair is biased at 1.8 V. The output-drive voltage (V_{OL}/V_{OH}) is measured on QA_0 and YQ_0. The propagation delay is measured on the output (O_BS) of the buffer string; the definition is the time delay from the triggering edge at the CLOCK input to the switching edge at the output O_BS. Both the delays of low-to-high and high-to-low output transitions are measured; the reported delay is the average of these two measurements. The transition characteristics, measured on the output O_BS, are shown as oscilloscope captures.

Table 2 Logic Design for Parametric Measurements

Parameters	Logic Design
1. Functionality	All key logic functions (O_BS, O_ANDP_CLKF, O_ORP_CLKF, O_FF_CLKF, O_ANDC_CLKF, O_ORC_CLKF, O_ANDP_CLKG, O_ORP_CLKG, O_FF_CLKG, O_ANDC_CLKG, O_ORC_CLKG, O_ANDP_CLKH, O_ORP_CLKH, O_FF_CLKH, O_ANDC_CLKH, O_ORC_CLKH, O_ANDP_HCLKA, O_ORP_HCLKA, O_FF_HCLKA, O_ANDC_HCLKA, and O_ORC_HCLKA), and outputs of embedded RAM (OUTX0, OUTX1, OUTX2, OUTX3, OUTX4, OUTX5, OUTX6 and OUTX7)
2. ICC (ICCA/ICCI)	DUT power supply
3. Input Threshold (VIL/VIH)	Single ended inputs (EN8/YQ0, DA/QA0, IO_I1/IO_O1, IO_I2/IO_O2, IO_I3/IO_O3, IO_I4/IO_O4, IO_I5/IO_O5, IO_I6/IO_O6), and differential inputs (DIO_I1P/DIO_O1, DIO_I2P/DIO_O2, DIO_I3P/DIO_O3, DIO_I4P/DIO_O4, DIO_I5P/DIO_O5, DIO_I6P/DIO_O6, DIO_I7P/DIO_O7)
4. Output Drive (VOL/VOH)	Output buffer (EN8/YQ_0, DA/QA_0)
5. Propagation Delay	String of buffers (CLOCK to O_BS)
6. Transition Characteristic	String of buffers output (O_BS)

III. Test Results

A. Functionality

Every DUT passed the pre-irradiation and post-annealing functional tests. The as-irradiated DUT is functionally tested on the output (O_FF_HCLKA) of the largest shift register.

B. Power Supply Current (ICCA and ICCI)

Figure 2 through Figure 7 plot the influx standby ICCA and ICCI versus total dose for each DUT. Table 3 summarizes the pre-irradiation, post-irradiation and post-annealing ICC. The post-annealing ICC for four different bit patterns, all '0', all '1', checkerboard and inverted-checkerboard, in the RAM are basically the same.

Table 3 Pre-irradiation, Post Irradiation and Post-Annealing ICC

DUT	Total Dose krad(SiO ₂)	ICCA (mA)			ICCI (mA)		
		Pre-irrad	Post-irrad	Post-ann	Pre-irrad	Post-irrad	Post-ann
2497	300 krad	1	238	17	26	151	62
2520	300 krad	2	171	11	27	160	64
2521	300 krad	2	86	5	30	155	70
2532	200 krad	1	7	3	28	64	20
2543	200 krad	3	12	2	28	69	43
2550	200 krad	4	9	5	28	67	46

In compliance with TM1019.8 subsection 3.11.2.c, the post-irradiation-parametric limit (PIPL) for the post-annealing ICCI in this test is defined as the addition of highest ICCI, ICCDA and ICCDIFFA values in Table 2-4 of the RTAXS spec sheet:

http://www.microsemi.com/soc/documents/RTAXS_DS.pdf

For ICCA, the PIPL is 500 mA; the PIPL of ICCI equals to $35+10+3.13\times 7 = 66.91$ (mA). Note that there are 7 pairs of differential LVPECL inputs in each DUT. Based on these PIPL, post-annealed DUT passes both the ICCA and ICCI spec for 200 krad (SiO₂).

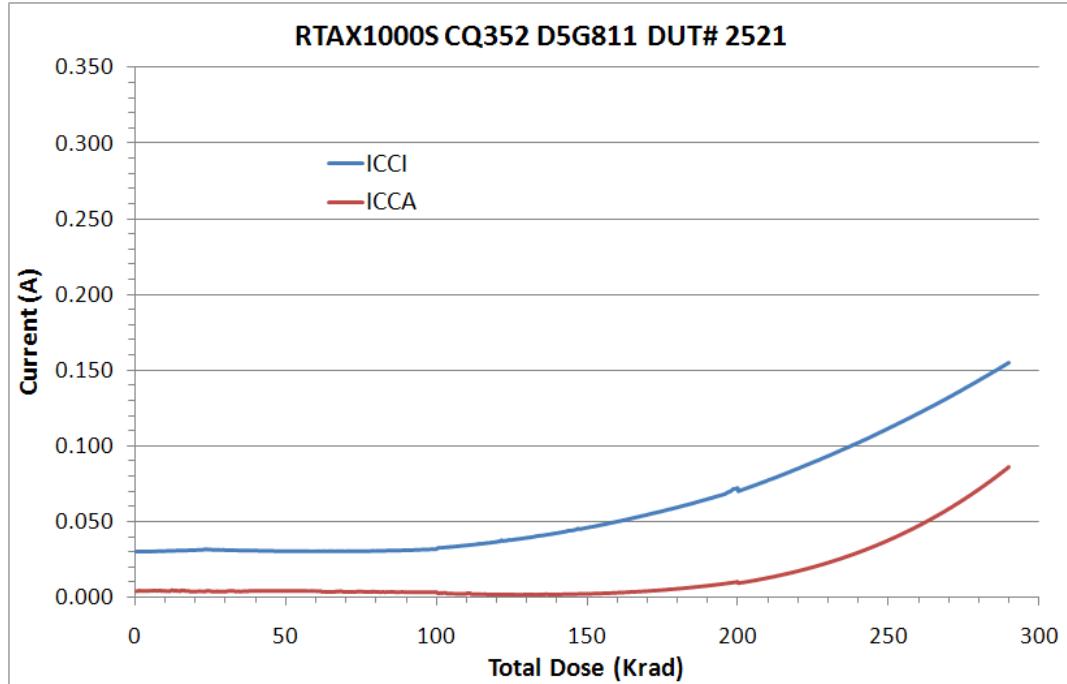

Figure 4 DUT 2521 Influx ICCA and ICCI

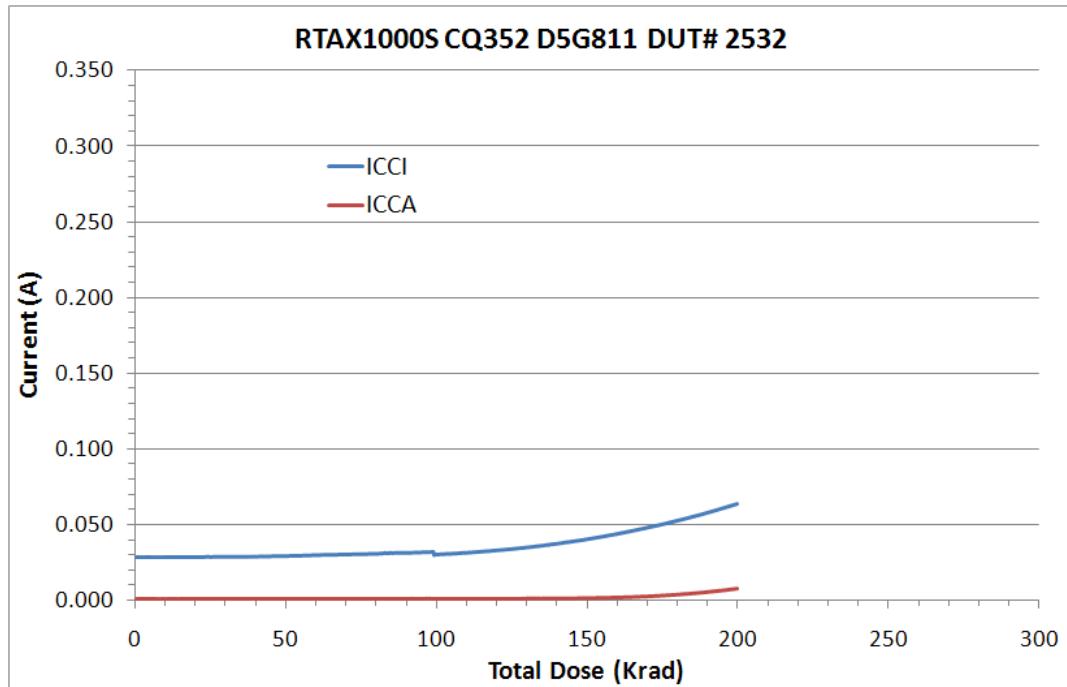

Figure 5 DUT 2532 Influx ICCA and ICCI

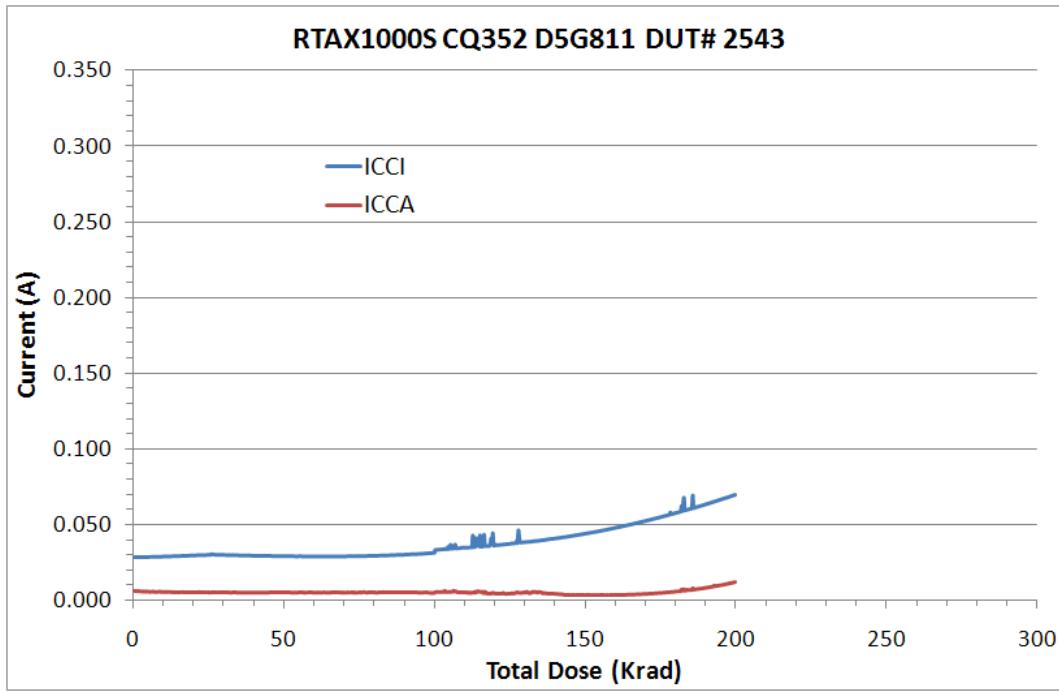

Figure 6 DUT 2543 Influx ICCA and ICCI, more measurement noises are seen on this run

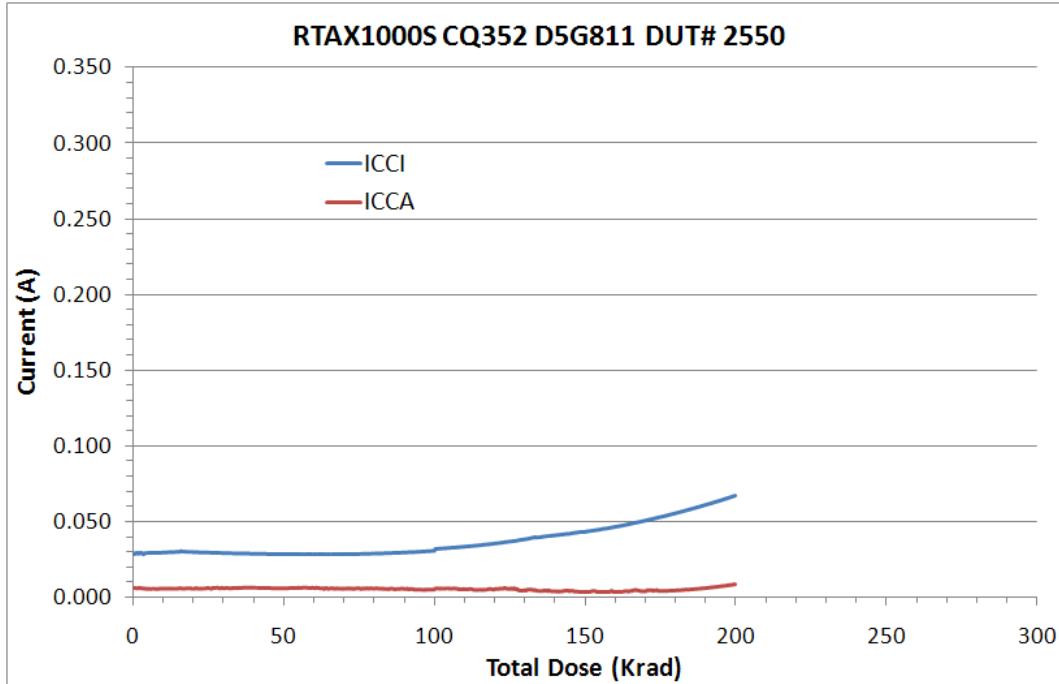

Figure 7 DUT 2550 Influx ICCA and ICCI

C. Single-Ended Input Logic Threshold (VIL/VIH)

Table 4a through Table 4c list the pre-irradiation and post-annealing single-ended input logic threshold. All data are within the specification limits. The post-annealing shift in every case is very small. There are two DUTs with two pins damaged at the beginning, hence no measurement data shown in these boxes.

Table 4a Pre-Irradiation and Post-Annealing Input Thresholds

F. Propagation Delay

The propagation delay was measured in-situ, post-irradiation, and post-annealing. The irradiation was temporarily stopped at each total-dose increment of 100 krad for the measurement. Each measurement has a 2-minute wait after a DUT is removed from the chamber. The results are plotted in Figure 8, and listed in Table 8. As shown in Figure 8, the propagation delay initially decreases with the total dose, but the change is small throughout the irradiation. Referring to influx static current plots (Figure 2-7), a device probably heats up as the dose increases. The rising temperature could be the root cause of the increasing trend at high doses. The post-annealing data, on the other hand, show decreased delay in every case.

The radiation delta in every case is well within the 10% degradation criterion. User can take the worst case for the design-margin consideration.

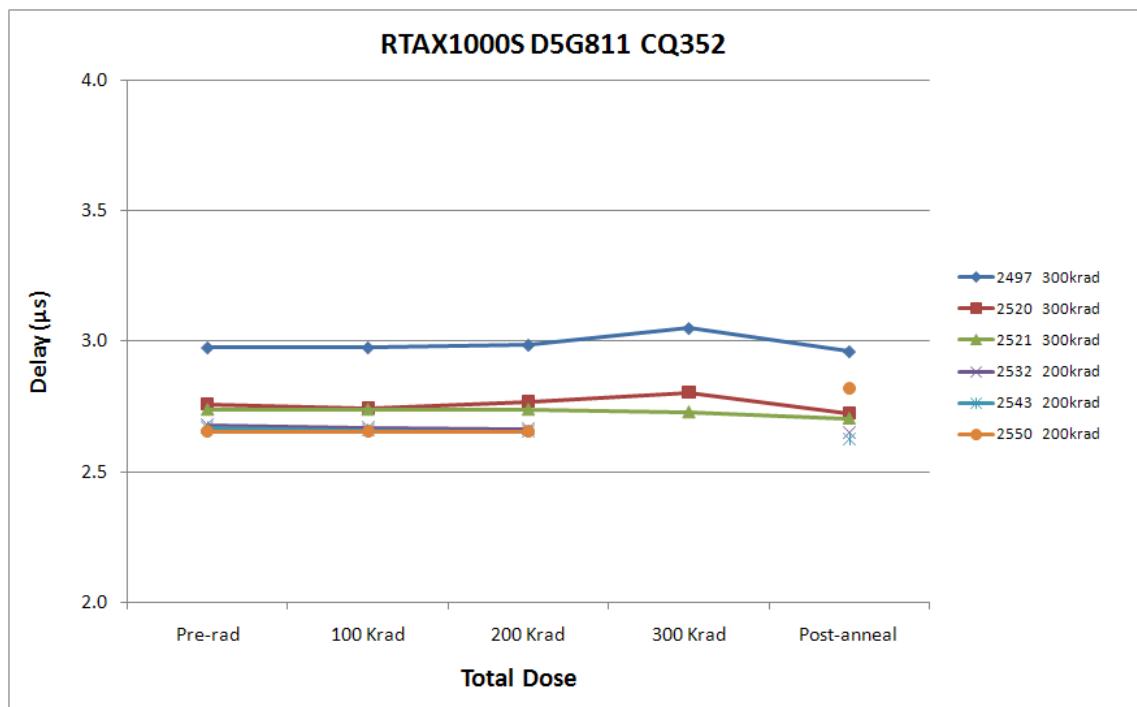

Figure 8 In-Situ Propagation Delay versus Total Dose
The measurement is performed outside the irradiation chamber.

Table 8 Radiation-Induced Propagation-Delay Degradations

	RTAX1000S D5G811 CQ352						
Delay (μs)							
	DUT	Total Dose	Pre-rad	100 krad	200 krad	300 krad	Post-ann

G. Transition Characteristics

Figure 9a through Figure 20b show the pre-irradiation and post-annealing transition edges. In each case, the radiation-induced transition-time degradation is insignificant.

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor solutions for: aerospace, defense and security; enterprise and communications; and industrial and alternative energy markets. Products include high-performance, high-reliability analog and RF devices, mixed signal and RF integrated circuits, customizable SoCs, FPGAs, and complete subsystems. Microsemi is headquartered in Aliso Viejo, Calif. Learn more at www.microsemi.com.
