

8 Ports Power Over Ethernet Manager

DATASHEET

DESCRIPTION

Microsemi's PD69008 Power over Ethernet (PoE) Manager chip integrates power, analog and state of the art embedded core logic into a single 80-pin, plastic QFP package. The device is used in Ethernet switches and Midspans to enable network devices to share power and data over the same cable.

PD69008 device is an 8-port, mixed-signal, high-voltage Power over Ethernet driver. It enables detection of IEEE802.3af-2003 compliant PDs (Powered Devices) and IEEE802.3AT High Power Devices, thus, ensuring safe power feeding and disconnection of ports. With full digital control via a serial communication interface and a minimum of external components, the device integrates into multi-port and highly populated Ethernet switches and routers.

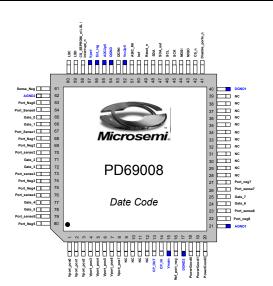

The PD69008 executes all real time functions as specified in the IEEE802.3af-2003 ("AF") standard and IEEE802.3at High Power ("AT") functionality, including load detection, "AF" and "AT" classification and port status monitoring. In addition it performs system level activities such as power management and MIB support for system management. The PoE device is designed to detect and disable disconnected ports, utilizing both DC and AC disconnection methods, as specified in the IEEE 802.3af-2003 standard.

The PD69008 is designed to support 2 main configurations:

- Auto mode: For Basic "AF" and "AT" PSE equipment
- Enhanced mode: For High End, Extended features set of AF and AT PSE equipment.

IMPORTANT: For the most current data, consult *MICROSEMI*'s website: http://www.microsemi.com

PACKAGE PIN OUT

KEY FEATURES

PD69008 Auto Mode features:

- ◆ Fully IEEE802.3af-2003 compliant
- Designed to support IEEE802.3at including two-event classification
- Supports pre-standard PD detection
- Supports Cisco devices detection
- IETF Power Ethernet MIB (RFC 3621) compliant
- ♦ Single DC voltage input (44v-57v)
- ♦ Wide temperature range: -40° C to +85° C
- Low thermal dissipation (0.5 Ω sense resistor)
- Drives 8 independent two-pairs power ports or 64-pairs ports
- Can cascade up to 8 PoE devices (64 ports)
- ♦ EEPROM interface for software patching and parameter configuration
- I²C Host interface
- Supports Interrupt out pin
- Dynamic power management
- Emergency power management supporting three configurable Power Bank I/Os
- ♦ Direct register communication
- ♦ Direct LED drive supporting one or two colors
- ♦ Continuous monitoring per port and system data
- ◆ Parameter setting per port and per system
- Power soft start algorithm
- ◆ Thermal monitoring/protection
- ♦ Voltage monitoring/protection
- ♦ H/W disable ports input
- ♦ Built in 3.3 V regulator
- ♦ Internal power on reset
- Enhanced SPI bus for internal communication
- ♦ External EEPROM for system parameters update
- ♦ SW ROM patch option
- RoHS compliant

Enhanced Modes Additional Features:

- ♦ I²C or UART Host interface
- ♦ Serial communication protocol backwards compatible with PD63000 and PDIC66000
- Added monitoring
- Extended parameters setting
- Port matrix for flexible PCB Layout
- Field upgradeable software
- Emergency Power Management with four power supplies

DATASHEET

NOTES:

- 1. DATUMS T, U AND Z TO BE DETERMINED WHERE THE LEADS EXIT THE PLASTIC BODY AT DATUM PLANE H.
- 2. DIMENSIONS D AND E DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PER SIDE. DIMENSIONS D AND E ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
- 3. DIMENSION 6 DOES NOT INCLUDE DAM BAR PROTRUSION. ALLOWABLE DAM BAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM 6 DIMENSION BY MORE THAN 0.08mm. DAM BAR CAN NOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN A PROTRUSION AND AN ADJACENT LEAD IS 0.07mm.
- A EXACT SHAPE OF EACH CORNER IS OPTION.

Figure 1: PD69008 Package Description

8 Ports Power Over Ethernet Manager

MAIN FEATURES DESCRIPTION							
Feature	Description						
	PD69008 Auto Mode Features						
IEEE802.3af-2003 and IEEE802.3at Compliant	The PD69008 meets all IEEE-802.3AF-2003 standard requirements and all IEEE802.3at draft requirements such as: • Multi – point resistor detection • AF and AT PD classification function including two-events • AC disconnect and DC disconnect functions • Supports Back-off feature for Midspan implementation						
IETF Power Ethernet MIB	The PD69008 meets all IETF power Ethernet MIB (RFC 3621) requirements such as: port						
(RFC 3621) Compliant	enable/disable, port priority, classification, error counters and system/port power consumption.						
O' - I - DO Walker - I 1	The PD69008 requires a single DC voltage source: 44V to 57V. No additional voltage sources						
Single DC Voltage Input	(e.g. 3.3V/5V) are required for the PoE system's operation.						
	The PD69008 can operate in a very wide temperature range: -40°c to +85°c.						
Wide temperature range: -40°c to +85°c	This wide temperature range enables to integrate the PD69008 into small unventilated boxes						
-40 € 10 103 €	and be used in harsh environments.						
Low power dissipation	The PD69008 has an exposed pad which keeps the device in low temperatures. The Rsense						
(0.5Ω sense resistor and	in PD69008 applications is only 0.5Ω and the external FET can be selected to be less than						
<0.2Ω FET)	0.2Ω, reducing power dissipation and allowing for fan-less operation						
Drives 8 Independent	The PD69008 has high port density (eight ports), integrated into a single device, thus saving						
Power Ports	PCB space, reducing PoE system cost and simplifying the circuit design.						
	The PD69008 is designed to drive eight external Power FET in order to implement flexible						
External Power FET Per Port	power solution and simplify circuit design, allowing the customer to fit the FET to the						
	temperature and current requirements of the application.						
Can be Cascaded for up	PD69008 PoE devices can be cascaded for up to 64 ports PoE system, utilizing 8 PoE						
to 8 PoE Devices	devices that fit into a Auto Mode Master/Slave configuration.						
I ² C Communication for Internal Interface	Allows communication between the Host CPU and the PoE devices for monitoring and setting.						
	When working in either Auto Mode or Enhanced Mode, the system supports the following						
Power Management	power management modes: Class mode, Allocation mode, Dynamic and Auto-PM mode that						
	combines all modes. The power management feature is a continuous real-time algorithm						
	utilized to protect against over-power consumption. Disconnection and connection of ports is						
	performed as specified in the power management mode.						
_	Three power supply indication inputs for quick shutdown of ports according to pre-defined						
Emergency Power Management	priority table in cases where power supply failure occurs. Four power supplies are supported						
	in the Enhanced Mode						
Direct Register	The Host CPU communicates with the PoE devices by writing and reading to/from						
Communication	their registers.						
	The Host CPU can receive on-line information per port such as:						
Continuous Monitoring	Port current and power measurement						
per Port	Port class						
	Port Status (on, off, overload, short and more)						

8 Ports Power Over Ethernet Manager

	On-line system telemetries for the Host CPU, such as:					
Continuous System	Voltage measurement					
data	Total system and per port power consumption					
	System and ICs status					
	Configurable parameters via the Host CPU, such as:					
	Port priority					
Parameter Setting per	Power management parameters (power limit, Guard band level, PM					
Port and Per System	mode)					
	Forced power and disable power per port					
	AC/DC disconnect method					
Pre-Standard PD Detection	Enables detection and powering of pre-standard devices (PDs).					
Detection of Cisco Devices	Enables detection and powering of all Cisco devices including pre-standard terminals.					
	Enables the Host-CPU to reduce communication volume.					
	Whenever a PoE event (masked by the CPU) occurs, the PoE Controller sends an					
Interrupt - Out	interrupt to the Host for notification. Events are port-based, chip-based, or system-					
	based ⁽¹⁾ .					
150.0	Direct SPI interface to an external LED Stream circuitry. It enables the designer to					
LED Support	implement a simple LED circuit without any software code ⁽¹⁾					
	SW code updates and configuration using external EEPROM or Downloaded by the					
Code Patching	HOST CPU (1)					

⁽¹⁾ When using Interupt_n pin - LED stream and external EEPROM support are not available. For more information refer to Microsemi's PoE Application Notes

8 Ports Power Over Ethernet Manager

Feature	Description
	Enhanced Modes – Additional Features
I ² C / UART Host interface	Allows I ² C communication or UART communication between the Host CPU and the PoE controller for continuous monitoring and for port parameter setting using the serial communication protocol backwards compatible with the PD63000 and the PDIC66000.
Additional Continuous Monitoring per Port and Per System	The Host-CPU can receive additional information from the PoE controller such as: Additional port statuses, port matrix, PoE interrupt events, etc.
Additional parameters setting per Port and Per System	The Host-CPU can configure additional parameters such as: LEDs parameters, port matrix, PoE Controller interrupt-out masks, flags, etc.
Port Matrix	Allows the layout designer to connect the physical ports to the logical ports whenever needed.
Software Download for Program Upgrading	Allows upgrading of the PoE mode software via download procedure in the field.

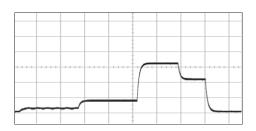

8 Ports Power Over Ethernet Manager

DATASHEET

MAIN FUNCTIONAL SIGNALS DESCRIPTION

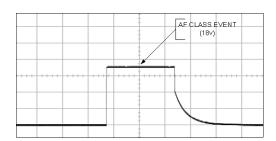

Detection Signal

Waveform of the PSE output when performing line detection procedure is shown below. The PoE device utilizes 4 voltage levels over the output port.

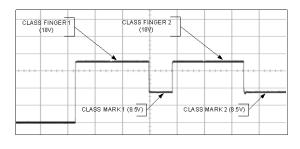

AF Class Signal

Waveform of the PSE output AF classification is shown below; Once the PD is recognized as a valid PoE PD, the classification voltage is applied, followed by full operating power.

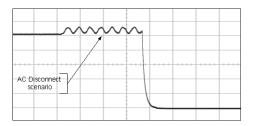

MCA Class Signal

Waveform of the PSE output MCA classification is shown below; Once the PD is recognized as a valid Type 2 PoE PD (high power PD), the classification event 1 voltage is applied (18v), followed by a mark 1 event voltage followed again by classification event and mark event.

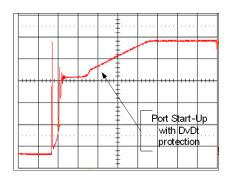

AC Disconnect

When a valid PD is connected to the port terminals, the AC signal amplitude sensed is as low as ~10 mVp-p. When the PD disconnects from the PSE terminals, the AC signal amplitude sensed rises. After several high pulses (300-400 ms), the port power shuts down.

Start Up Event

After the detection and classification phases end, the PSE will apply the full operation voltage.

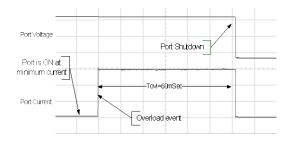

Overload Event

If port current in exceeds ICUT threshold for longer than Tovl, the PSE removes power from the PI as shown in the figure below.

DYNAMIC CHARACTERISTICS

The PD69008 utilizes three programmable current level thresholds (I_{min} , I_{cut} , I_{lim}) and three timers (T_{min} , T_{cut} , T_{lim}). Loads that dissipate more than I_{cut} for longer than T_{cut} are classified as 'overloads' and are automatically shutdown. Loads that consume I_{lim} current for more than T_{lim} are shutdown and classified as 'short circuit state'.

In cases where the PD69008 is configured to operate in DC-Disconnect mode, and the output current is below I_{min} for more than T_{min} , the PD is classified as 'no-load' and is shutdown. In cases where the PD69008 is configured to operate in AC-Disconnect mode, and the load's impedance is above a pre-defined impedance for more than T_{min} , the PD is classified as 'no-load' and is shutdown.

Automatic recovery from overload and no-load conditions is attempted every period of T_{OVLREC} and T_{UDLREC} (typically 5 and 1 seconds, respectively). Output power is limited to I_{lim} , which is a maximum peak current allowed at the port.

		AF PORTS PARAMETERS				
PARAMETER		CONDITIONS	MIN.	TYP.	MAX.	UNIT
Automatic recovery from overload shutdown		value, measured from port shutdown modified through control port)		5		S
Automatic recovery from no-load shutdown		value, measured from port shutdown modified through control port)		1		s

8 Ports Power Over Ethernet Manager

DATASHEET

THERMAL DATA

Power Dissipation

The internal power consumption of a single device from the DC input is based on the following:

Input voltage range...... 44 to 57 VDC

Input current...... 13.6 mA typical; 16 mA max.

 $P_{main} = V_{main} \times I_{main}$

 P_{main} typ. = 48 VDC x 13.6 mA = 0.652W

 P_{main} max. = 57 VDC x 16 mA = 0.912 W

The above data is considered with no external current consumption on Vperi (or with external NPN)

PROTECTION MECHANISM

The PD69008 has an internal thermal protection designed to protect against junction overheating. Two temperature sensors are integrated into the device: they are used for protection and for temperature monitoring.

Thermal protection mechanism protects the functionality of the device, in cases where over – temperature occurs.

Maximum temperature for ports operation = 155°C

Above this temperature the PD69008 will automatically shut down the ports to protect the device from overheating.

The PD69008 will turn-on the ports again after the temperature will decrease back to 130°C

An Interrupt will be generated from Interrupt_n pin when the measured temperature will reach the pre defined level in temperature alarm register.

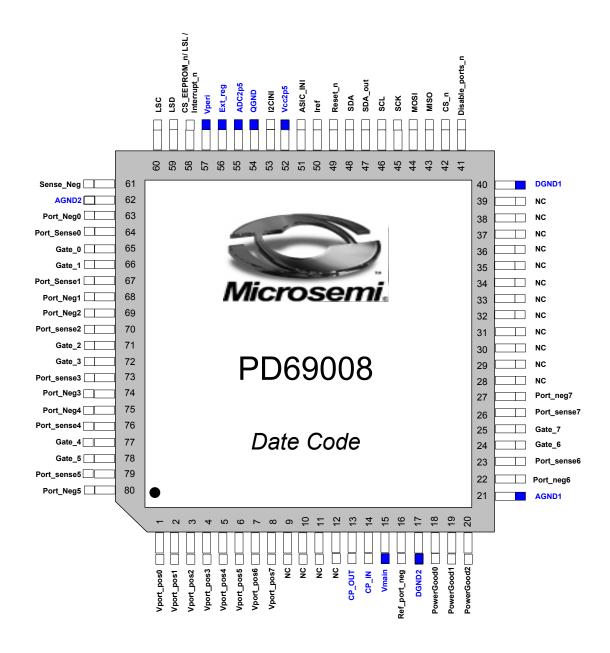

Indicator Sensors

The temperature sensors monitor the local temperature inside the device. Their average temperature value is calculated by the PD69008. All values are stored in internal registers for data retrieval.

DATASHEET

CONFIGURATION PINS

There are two main configuration pins utilized in the PD69008 (as shown in Figure 3) which configure the operation mode of the chip and the communication addresses (SPI and I²C).

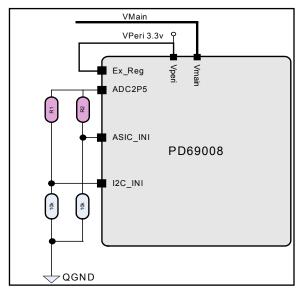

Figure 3: Electronic Connection of Configuration Pins

ASIC_INI

PoE Device's configuration is performed via the ASIC_INI pin, as shown in the following table. The ASIC_INI analog signal is converted into a 10-bit register (A/D). Once a hard Reset pulse is detected, the data is latched into an internal mode register.

Step	Minimum Voltage	Maximum Voltage	Mode	E-SPI Address (B2-B0)	Description
0	0	0.14	Master	000	Stand Alone Master Mode configuration – power management master
1	0.19	0.29	Slave0	000	Set the E-SPI address in Stand Alone Slave & macro Modes
2	0.35	0.44	Slave1	001	Set the E-SPI address in Stand Alone Slave & macro Modes
3	0.51	0.6	Slave2	010	Set the E-SPI address in Stand Alone Slave & macro Modes
4	0.67	0.75	Slave3	011	Set the E-SPI address in Stand Alone Slave & macro Modes
5	0.83	0.9	Slave4	100	Set the E-SPI address in Stand Alone Slave & macro Modes
6	0.99	1.06	Slave5	101	Set the E-SPI address in Stand Alone Slave & macro Modes
7	1.15	1.21	Slave6	110	Set the E-SPI address in Stand Alone Slave & macro Modes
8	1.3	1.36	Slave7	111	Set the E-SPI address in Stand Alone Slave & macro Modes
9-15	2.35	2.5	Manual	000	Internal use only – debug mode

Notes:

In the Auto mode – the PD69008 communicates with the Host via the I²C bus.

In the other modes – the PD69008 is communicates with the controller via the ESPI bus or I²C

8 Ports Power Over Ethernet Manager

DATASHEET

I2C_ADDRESS

A standard I²C interface is used to communicate between the PD69008 and the Host controller in Auto Mode, with a bit-rate of up to 400 kb/s. The I²C address is determined by the I²C INI and ASIC INI pins as shown in the below tables:

The I²C address is created by the following register:

MSB LSB

4 bit based on I ² C INIT			3 bit based on ASIC INI			
Voltage Level			Voltage Level			
A4	A3	A2	A1	B2	B1	B0

ASIC_INI Voltage Level	B2, B1, B0
0 to 15 according to ASIC_INI table	ESPI address

I2C Address Step	I2C_INI Voltage Level (Volt)		I2C_INI Internal Register (A4-A1)	Notes
	MIN	MAX		
0	0	0.14	0000	General call address – Should not be used
1	0.19	0.29	0001	
2	0.35	0.44	0010	
3	0.51	0.6	0011	
4	0.67	0.75	0100	
5	0.83	0.9	0101	
6	0.99	1.06	0110	
7	1.15	1.21	0111	
8	1.3	1.36	1000	
9	1.46	1.51	1001	
10	1.62	1.67	1010	
11	1.78	1.82	1011	
12	1.94	1.97	1100	
13	2.05	2.13	1101	
14	2.25	2.28	1110	
15	2.35	2.5	1111

DATASHEET

BLOCK DIAGRAM

The PD69008 PoE Manager (see Figure 4) complies with all the IEEE standard 802.3at detection requirements. The PD69008 is built around two major sections:

- 1. A common Digital section that serves all eight channels
- 2. Eight separate identical channels for driving ports

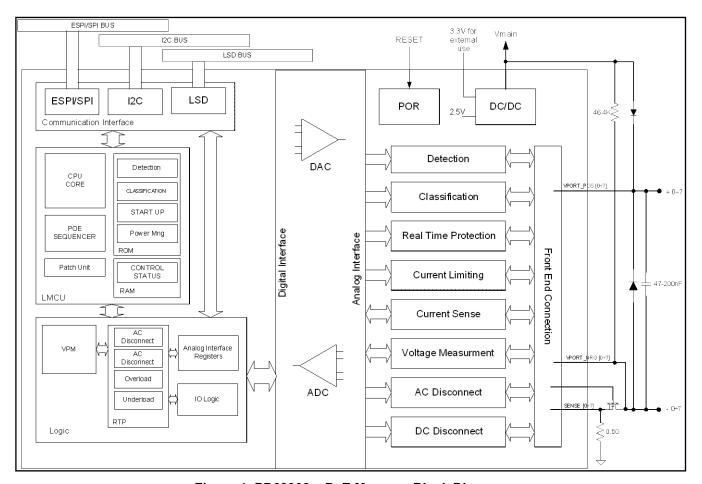

Figure 4: PD69008 - PoE Manager Block Diagram

COMMUNICATION I/O

The PD69008 incorporates two communication interfaces. The first interface is an SPI bus which connects the PD69008 devices to each other, or to the external Controller. The second interface is an I²C utilized to communicate with Host. Both interfaces send the contents of the internal registers between the PD69008 logic and the PoE Controller. LEDs indication circuit is supported by using the LED Stream Data bus (LSD).

POWER MANAGEMENT

Receives data from the PoE sequencer and distribute total power to all relevant ports according to priority levels, depending on the system's total power.

8 Ports Power Over Ethernet Manager

DATASHEET

DETECTION

The PoE Controller or the PoE sequencer generates a request to apply separate voltage levels to the output port. A measurement circuit monitors the difference between the various levels.

Voltage differences are compared with values stored in the registers. By comparing these values, the system can determine whether to enable a port or not.

CLASSIFICATION

Upon request from the PoE Controller or from the PoE sequencer, the state machine applies a regulated Class Event and Mark Event voltages to the ports as required by the IEEE standard.

The current is measured by comparing the real current flow with a number of preset thresholds; in this manner the class is verified.

OVERLOAD

This block senses when port current exceeds the maximum current level as specified in the IEEE-802.3at standard, and disconnects the port if required.

AC DISCONNECT

The system applies a sinusoidal signal to the positive port terminal. The voltage developed on the port terminals is proportional to the load's value. If the load is high, the AC component riding on the port terminals is low. If the load is low, the AC component is high. A dedicated circuit measures the AC component level and compares it with a pre-defined value stored in a register. Based on the comparison's results, the system determines whether to disable a port or not.

DC DISCONNECT

This block senses when the port current drops below 7.5 mA. If this is the case, timers in the Channel RT Controller start counting. The Channel RT Controller acts in accordance with pre-programmed thresholds limits and time windows, prior to initiating a disconnect status for that port. The circuitry takes into account PDs that modulate their current consumption, disconnecting them only if necessary.

POWER ON RESET (POR)

The POR Monitors the internal DC levels; if these voltages drop below specific thresholds, a Reset signal is generated and the PD69008s are reset via the RESET N pin.

C/DC CIRCUIT

This circuit produces 2.5V and 3.3v, derived from the main supply.

REAL TIME PROTECTION

This circuitry performs all real time measurements and sends the results to the logic circuitry in order to determine whether to disconnect a port or not.

8 Ports Power Over Ethernet Manager

DATASHEET

CURRENT LIMIT

This circuit continuously monitors the current of powered ports and limits the current to a specific value in cases where an over load occurs. If the current exceeds a specific level, the system starts measuring the elapsed time. If this time period is greater than a preset threshold, the port is disconnected.

LMCU CONTROLLER

The LMCU has an integrated CPU, RAM and ROM memories. Certain major functions are managed by the LMCU core running the SW from the ROM.

TYPICAL APPLICATION

The PD69008 can be integrated into a number of applications such as daughter boards, Ethernet switches or routers. Examples of such applications are described below:

Integrated directly into a switch: Facilitates entire PoE concept by including the IC(s) on the main switch's PCB.

<u>Daughter board add-on:</u> The IC is integrated into a small dedicated PoE PCB, mounted on top of the switch's main PCB or into a DIMM module.

Integrated into an RJ45 connector: Saves space on the main board and creates small differences between the PoE and non-PoE versions of a switch.

<u>Midspans:</u> Stand-alone devices, installed between the Ethernet switch and the PDs (Powered Devices) such as telephones, cameras, wireless LANs, etc.

These Midspans include the PD69008 IC as a PoE control element, destined to inject power over the communication lines

Figure 5 and Figure 6 provide examples of basic applications of the PD69008 in an AC Disconnect Mode and the DC Disconnect Mode:
