Introduction

This macro library guide supports the SmartFusion2 and IGLOO2 families. See the Microsemi website for macro guides for other families.

This guide follows a naming convention for sequential macros that is unambiguous and extensible, making it possible to understand the function of the macros by their name alone.

The first two mandatory characters of the macro name will indicate the basic macro function:

- DF - D-type flip-flop
- DL - D-type latch

The next mandatory character indicates the output polarity:

- I - output inverted (QN with bubble)
- N - output non-inverted (Q without bubble)

The next mandatory number indicates the polarity of the clock or gate:

- 1 - rising edge triggered flip-flop or transparent high latch (non-bubbled)
- 0 - falling edge triggered flip-flop or transparent low latch (bubbled)

The next two optional characters indicate the polarity of the Enable pin, if present:

- E0 - active low enable (bubbled)
- E1 - active high enable (non-bubbled)

The next two optional characters indicate the polarity of the asynchronous Preset pin, if present:

- P0 - active low asynchronous preset (bubbled)
- P1 - active high asynchronous preset (non-bubbled)

The next two optional characters indicate the polarity of the asynchronous Clear pin, if present:

- C0 - active low asynchronous clear (bubbled)
- C1 - active high asynchronous clear (non-bubbled)

All sequential and combinatorial macros (except MX4 and XOR8) use one logic element in the SmartFusion2 and IGLOO2 families.

AND2

2-Input AND

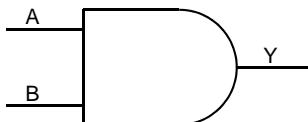

Figure 1 • AND2

Inputs	Output
A, B	Y

Truth Table

A	B	Y
X	0	0
0	X	0
1	1	1

AND3

3-Input AND

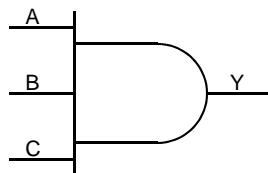

Figure 2 • AND3

Input	Output
A, B, C	Y

Truth Table

A	B	C	Y
X	X	0	0
X	0	X	0
0	X	X	0
1	1	1	1

AND4

4-Input AND

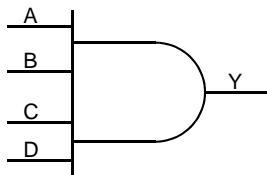

Figure 3 • AND4

Input	Output
A, B, C, D	Y

Truth Table

A	B	C	D	Y
X	X	X	0	0
X	X	0	X	0
X	0	X	X	0
0	X	X	X	0
1	1	1	1	1

BUFF

Buffer

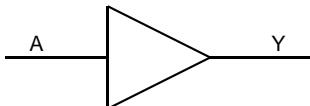

Figure 4 • BUFF

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

BUFD

Buffer. Note that Compile optimization will not remove this macro.

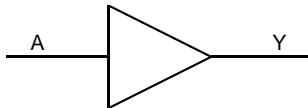

Figure 5 • BUFD

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

CLKINT

Macro used to route an internal fabric signal to global network.

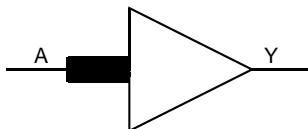

Figure 6 • CLKINT

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

GCLKINT

Gated macro used to route an internal fabric signal to global network. The Enable signal can be used to turn off the global network to save power.

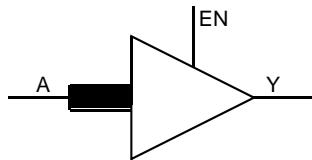

Figure 7 • GCLKINT

Input	Output
A, EN	Y

Truth Table

A	EN	Y
X	0	0
0	X	0
1	1	1

RCLKINT

Macro used to route an internal fabric signal to a row global buffer, thus creating a local clock.

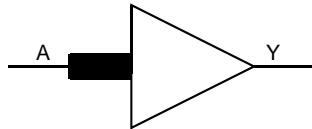

Figure 8 • RCLKINT

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

RGCLKINT

Gated macro used to route an internal fabric signal to a row global buffer, thus creating a local clock. The Enable signal can be used to turn off the local clock to save power.

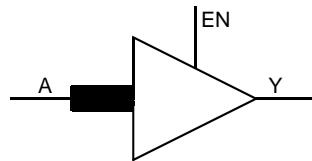

Figure 9 • RGCLKINT

Input	Output
A, EN	Y

Truth Table

A	EN	Y
X	0	0
0	X	0
1	1	1

SLE

Sequential Logic Element

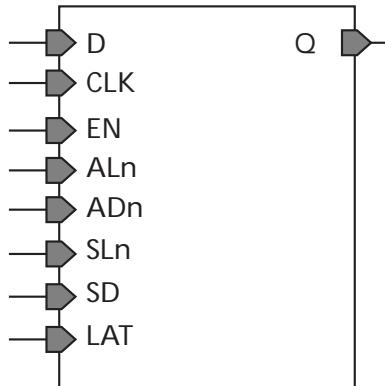

Figure 10 • SLE

Input	Output
D, CLK, EN, ALn, ADn, SLn, SD, LAT	Q

Truth Table

ALn	ADn	LAT	CLK	EN	SLn	SD	D	Q _{n+1}
0	ADn	X	X	X	X	X	X	!ADn
1	X	0	Not rising	X	X	X	X	Qn
1	X	0	↑	0	X	X	X	Qn
1	X	0	↑	1	0	SD	X	SD
1	X	0	↑	1	1	X	D	D
1	X	1	0	X	X	X	X	Qn
1	X	1	1	0	X	X	X	Qn
1	X	1	1	1	0	SD	X	SD
1	X	1	1	1	1	X	D	D

ARI1

The ARI1 macro is responsible for representing all arithmetic operations in the pre-layout phase

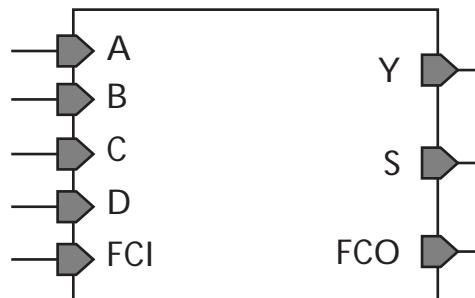

Figure 11 • ARI1

Input	Output
A, B, C, D, FCI	Y, S, FCO

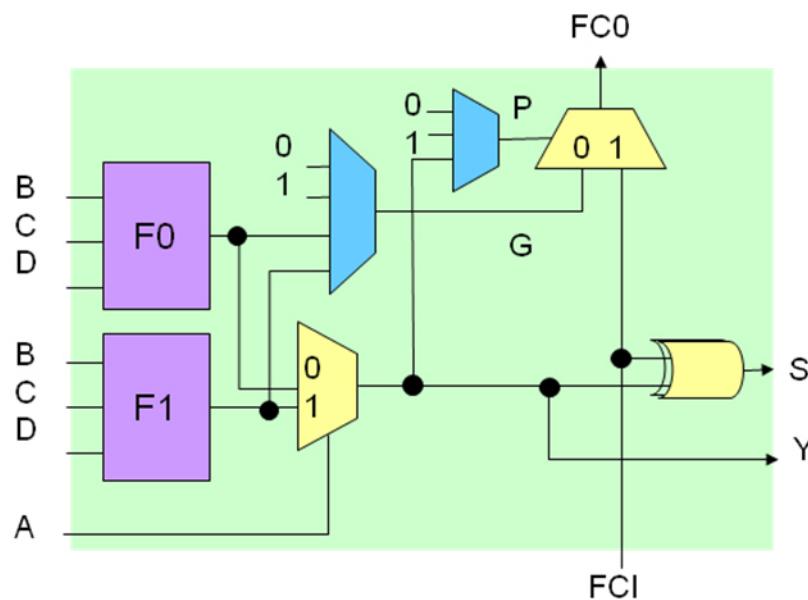

The ARI1 cell has a 20bit INIT string parameter that is used to configure its functionality. The interpretation of the 16 LSB of the INIT string is shown in the table below. F0 is the value of Y when A = 0 and F1 is the value of Y when A = 1.

Table 1 • Interpretation of 16 LSB of the INIT String for ARI1

ADCB	Y	
0000	INIT[0]	F0
0001	INIT[1]	
0010	INIT[2]	
0011	INIT[3]	
0100	INIT[4]	
0101	INIT[5]	
0110	INIT[6]	
0111	INIT[7]	
1000	INIT[8]	F1
1001	INIT[9]	
1010	INIT[10]	
1011	INIT[11]	
1100	INIT[12]	
1101	INIT[13]	
1110	INIT[14]	
1111	INIT[15]	

Table 2 • Truth Table for S

Y	FCI	S
0	0	0
0	1	1
1	0	1
1	1	0

Figure 12 • ARI1 Logic

The 4 MSB of the INIT string controls the output of the carry bits. The carry is generated using carry propagation and generation bits, which are evaluated according to the tables below.

Table 3 • ARI1 INIT[17:16] String Interpretation

INIT[17]	INIT[16]	G
0	0	0
0	1	F0
1	0	1
1	1	F1

Table 4 • ARI1 INIT[19:18] String Interpretation

INIT[19]	INIT[18]	P
0	0	0
0	1	Y
1	X	1

Table 5 • FCO Truth Table

P	G	FCI	FCO
0	G	X	G
1	X	FCI	FCI

FCEND_BUFF

Buffer, driven by the FCO pin of the last macro in the Carry-Chain.

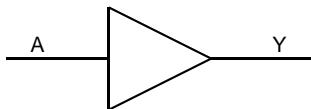

Figure 13 • FCEND_BUFF

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

FCINIT_BUFF

Buffer, used to initialize the FCI pin of the first macro in the Carry-Chain.

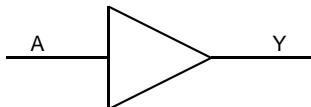

Figure 14 • FCINIT_BUFF

Input	Output
A	Y

Truth Table

A	Y
0	0
1	1

GCLKBUF

Gated input I/O macro to global network; the Enable signal can be used to turn off the global network to save power.

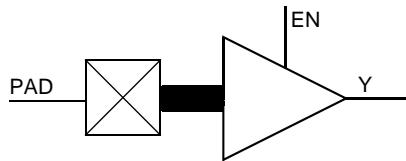

Figure 15 • GCLKBUF

Input	Output
PAD, EN	Y

Truth Table

PAD	EN	Y
X	0	0
Z	1	X
0	X	0
1	1	1

GCLKBUF_DIFF

Gated differential I/O macro to global network; the Enable signal can be used to turn off the global network, Differential I/O

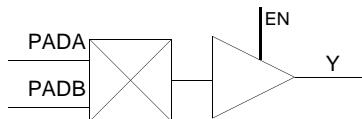

Figure 16 • GCLKBUF_DIFF

Differential

Input	Output
PAD, EN	Y

Truth Table

PADP	PADN	EN	Y
X	X	0	0
Z	Z	1	X
0	0	1	X
1	1	1	X
0	1	1	0
1	0	1	1

GCLKBIBUF

Bidirectional I/O macro with gated input to global network; the Enable signal can be used to turn off the global network to save power.

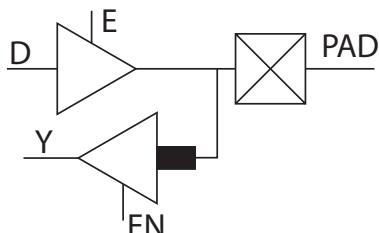

Figure 17 • GCLKBIBUF

Input	Output
D, E, EN, PAD	Y, PAD

Truth Table

D	E	EN	PAD	Y
X	0	0	X	0
X	0	1	Z	X

D	E	EN	PAD	Y
X	0	1	PAD	PAD
D	1	0	D	0
D	1	1	D	D

DFN1

D-Type Flip-Flop

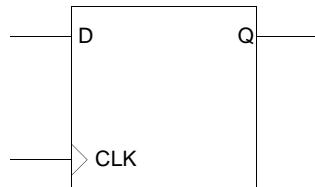

Figure 18 • DFN1

Input	Output
D, CLK	Q

Truth Table

CLK	D	Q_{n+1}
not Rising	X	Q_n
↑	D	D

DFN1C0

D-Type Flip-Flop with active low Clear

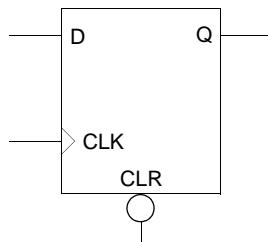

Figure 19 • DFN1C0

Input	Output
D, CLK, CLR	Q

Truth Table

CLR	CLK	D	Q_{n+1}
0	X	X	0

CLR	CLK	D	Q_{n+1}
1	not Rising	X	Q _n
1	↑	D	D

DFN1E1

D-Type Flip-Flop with active high Enable

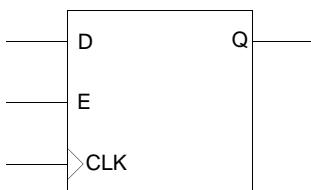

Figure 20 • DFN1E1

Input	Output
D, E, CLK	Q

Truth Table

E	CLK	D	Q_{n+1}
0	X	X	Q _n
1	not Rising	X	Q _n
1	↑	D	D

DFN1E1C0

D-Type Flip-Flop, with active high Enable and active low Clear.

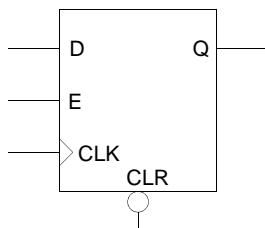

Figure 21 • DFN1E1C0

Input	Output
CLR, D, E, CLK	Q

Truth Table

CLR	E	CLK	D	Q_{n+1}
0	X	X	X	0

CLR	E	CLK	D	Q_{n+1}
1	0	X	X	Q _n
1	1	not Rising	X	Q _n
1	1	↑	D	D

DFN1E1P0

D-Type Flip-Flop with active high Enable and active low Preset.

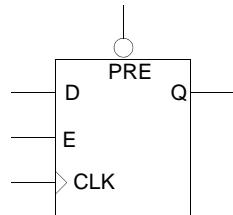

Figure 22 • DFN1E1P0

Input	Output
D, E, PRE, CLK	Q

Truth Table

PRE	E	CLK	D	Q_{n+1}
0	X	X	X	1
1	0	X	X	Q_n
1	1	not Rising	X	Q_n
1	1	↑	D	D

DFN1P0

D-Type Flip-Flop with active low Preset.

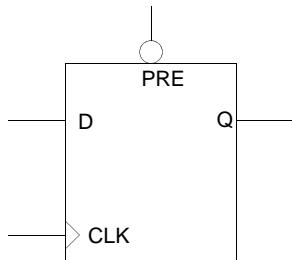

Figure 23 • DFN1P0

Input	Output
D, PRE, CLK	Q

Truth Table

PRE	CLK	D	Q _{n+1}
0	X	X	1
1	not Rising	X	Q _n
1	↑	D	D

DLN1

Data Latch

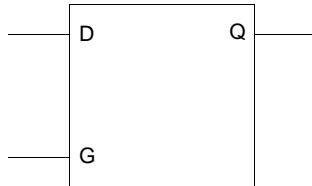

Figure 24 • DLN1

Input	Output
D, G	Q

Truth Table

G	D	Q
0	X	Q
1	D	D

DLN1C0

Data Latch with active low Clear

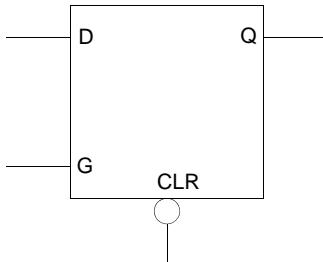

Figure 25 • DLN1C0

Input	Output
CLR, D, G	Q

Truth Table

CLR	G	D	Q
0	X	X	0
1	0	X	Q
1	1	D	D

DLN1P0

Data Latch with active low Preset

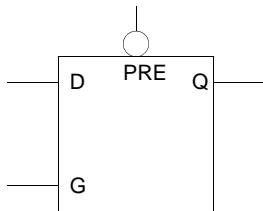

Figure 26 • DLN1P0

Input	Output
D, G, PRE	Q

Truth Table

PRE	G	D	Q
0	X	X	1
1	0	X	Q
1	1	D	D

INV

Inverter

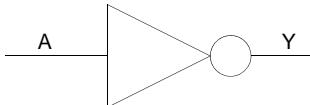

Figure 27 • INV

Input	Output
A	Y

Truth Table

A	Y
0	1
1	0

INVD

Inverter; note that Compile optimization will not remove this macro.

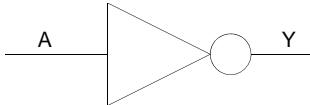

Figure 28 • INVD

Truth Table

A	B	C	Y
0	0	0	0
1	0	0	1
0	1	0	1
1	1	0	0
0	0	1	1
1	0	1	0
0	1	1	0
1	1	1	1

XOR4

4-input XOR

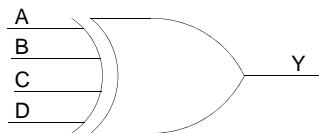

Figure 42 • XOR4

Input	Output
A, B, C, D	Y

Truth Table

A	B	C	D	Y
0	0	0	0	0
0	0	0	1	1
0	0	1	0	1
0	0	1	1	0
0	1	0	0	1
0	1	0	1	0
0	1	1	0	0
0	1	1	1	1
1	0	0	0	1
1	0	0	1	0
1	0	1	0	0
1	0	1	1	1
1	1	0	0	0
1	1	0	1	1
1	1	1	0	1
1	1	1	1	0

XOR8

8-input XOR

This macro uses two logic modules.

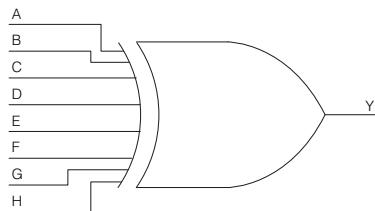

Figure 43 • XOR8

Input	Output
A, B, C, D, E, F, G, H	Y

Truth Table

If you have an odd number of inputs that are High, the output is High (1).

If you have an even number of inputs that are High, the output is Low (0).

For example:

A	B	C	D	E	F	G	H	Y
0	0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	1	1
0	0	0	0	0	0	1	1	0

UJTAG

The UJTAG macro is a special purpose macro. It allows access to the user JTAG circuitry on board the chip.

You must instantiate a UJTAG macro in your design if you plan to make use of the user JTAG feature. The TMS, TDI, TCK, TRSTB and TDO pins of the macro must be connected to top level ports of the design.

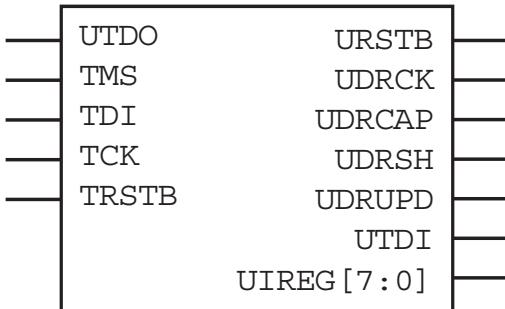

Figure 44 • UJTAG

Input	Output
UTDO	URSTB
TMS	UDRCK
TDI	UDRCAP
TCK	UDRSH
TRSTB	UDRUPD
	UTDI
	UIREG[7:0]
	TDO

BIBUF

Bidirectional Buffer

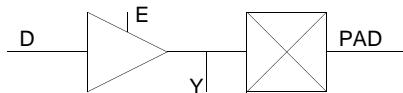

Figure 45 • BIBUF

Input	Output
D, E, PAD	PAD, Y

Truth Table

MODE	E	D	PAD	Y
OUTPUT	1	D	D	D
INPUT	0	X	Z	X
INPUT	0	X	PAD	PAD

BIBUF_DIFF

Bidirectional Buffer, Differential I/O

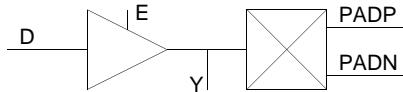

Figure 46 • BIBUF_DIFF

Input	Output
D, E, PADP, PADN	PADP, PADN, Y

Truth Table

MODE	E	D	PADP	PADN	Y
OUTPUT	1	0	0	1	0
OUTPUT	1	1	1	0	1
INPUT	0	X	Z	Z	X
INPUT	0	X	0	0	X
INPUT	0	X	1	1	X
INPUT	0	X	0	1	0
INPUT	0	X	1	0	1

CLKBIBUF

Bidirectional Buffer with Input to global network

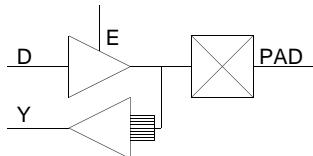

Figure 47 • CLKBIBUF

Input	Output
D, E, PAD	PAD, Y

Truth Table

D	E	PAD	Y
X	0	Z	X
X	0	0	0
X	0	1	1
0	1	0	0
1	1	1	1

CLKBUF

Input Buffer to global network

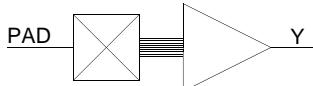

Figure 48 • CLKBUF

Input	Output
PAD	Y

Truth Table

PAD	Y
0	0
1	1

CLKBUF_DIFF

Differential I/O macro to global network, Differential I/O

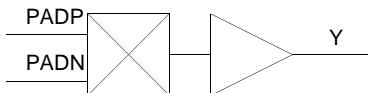

Figure 49 • INBUF_DIFF

Input	Output
PADP, PADN	Y

Truth Table

PADP	PADN	Y
Z	Z	Y
0	0	X
1	1	X
0	1	0
1	0	1

INBUF

Input Buffer

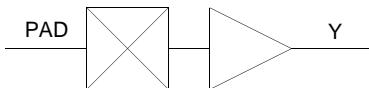

Figure 50 • INBUF

OUTBUF_DIFF

Output buffer, Differential I/O

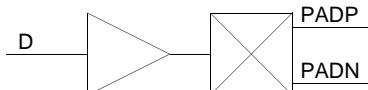

Figure 53 • OUTBUF_DIFF

Input	Output
D	PADP, PADN

Truth Table

D	PADP	PADN
0	0	1
1	1	0

TRIBUFF

Tristate output buffer

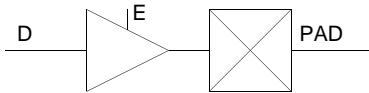

Figure 54 • TRIBUFF

Input	Output
D, E	PAD

Truth Table

D	E	PAD
X	0	Z
D	1	D

TRIBUFF_DIFF

Tristate output buffer, Differential I/O

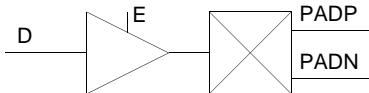

Figure 55 • TRIBUFF_DIFF

Input	Output
D, E	PADP, PADN

Truth Table

D	E	PADP	PADN
X	0	Z	Z
0	1	0	1
1	1	1	0

DDR_IN

Input DDR Register; input D must be connected to an I/O.

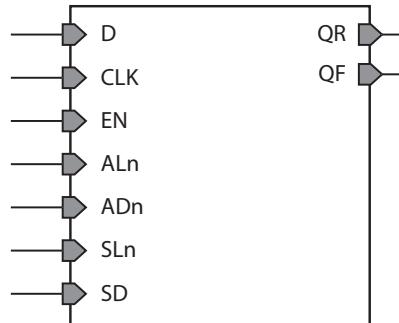

Figure 56 • DDR_IN

Input	Output
D, CLK, EN, ALn, ADn, SLn, SD	QR, QF

Truth Table

ALn	ADn	CLK	EN	SLn	SD	D	QR _(n+1)	QF _(n+1)
1	X	-	X	X	X	X	QR _n	QF _n
1	X	↑	0	X	X	X	QR _n	QF _n
1	X	↑	1	1	X	D	D	QF _n
1	X	↓	1	1	X	D	QR _n	D
1	X	↑	1	0	SD	X	SD	SD
0	ADn	X	X	X	X	X	!AD _n	!AD _n

DDR_OUT

DDR Output register; output Q must be connected to an I/O.

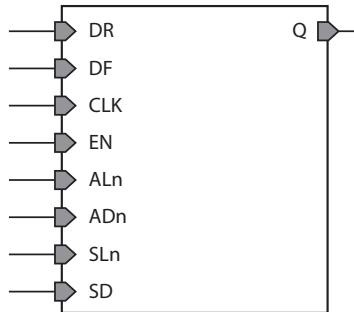

Figure 57 • DDR_OUT

Input	Output
DR, DF, CLK, EN, ALn, ADn, SLn, SD	Q

Truth Table

ALn	ADn	CLK	EN	SLn	SD	DR	DF	Qr	Qf	Q
0	ADn	X	X	X	X	X	X	!ADn	!ADn	!ADn
1	X	0	X	X	X	X	X	Qr	Qf	Qf

1	X	↑	1	0	SD	X	X	SD	SD	SD
1	X	↑	1	1	X	DR	DF	DR	DF	DR

RAM1K18

The RAM1K18 block contains 18,432 memory bits and is a true dual-port memory. The RAM1K18 memory can also be configured in two-port mode. All read/write operations to the RAM1K18 memory are synchronous. To improve the read data delay, an optional pipeline register at the output is available. A feed-through write mode is also available to enable immediate access to the write data. The RAM1K18 memory has two data ports which can be independently configured in any combination shown below.

1. Dual-Port RAM with the following configurations:

- 1Kx18, 1Kx16
- 2Kx9, 2Kx8
- 4Kx4
- 8Kx2
- 16Kx1

2. Two-Port RAM with the following configurations:

- 512x36, 512x32
- 1Kx18, 1Kx16
- 2Kx9, 2Kx8
- 4Kx4
- 8Kx2
- 16Kx1

The main features of the RAM1K18 memory block are as follows:

- A RAM1K18 block has 18,432 bits.
- A RAM1K18 block provides two independent data ports A and B.
- RAM1K18 has a true dual-port mode, for which both ports have word widths less than or equal to 18 bits.
- In true dual-port mode, each port can be independently configured to any of the following depth/width: 1Kx18, 1Kx16, 2Kx9, 2Kx8, 4Kx4, 8Kx2, and 16Kx1.
- The widths of each port can be different, but one needs to be a multiple of the other. There are 29 unique combinations of true dual-port aspect ratios:
 - 1Kx18/1Kx18, 1Kx18/2Kx9,
 - 1Kx16/1Kx16, 1Kx16/2Kx8, 1Kx16/4Kx4, 1Kx16/8Kx2, 1Kx16/16Kx1,
 - 2Kx9/1Kx18, 2Kx9/2Kx9,
 - 2Kx8/1Kx16, 2Kx8/2Kx8, 2Kx8/4Kx4, 2Kx8/8Kx2, 2Kx8/16Kx1,
 - 4Kx4/1Kx16, 4Kx4/2Kx8, 4Kx4/4Kx4, 4Kx4/8Kx2, 4Kx4/16Kx1,
 - 8Kx2/1Kx16, 8Kx2/2Kx8, 8Kx2/4Kx4, 8Kx2/8Kx2, 8Kx2/16Kx1,
 - 16Kx1/1Kx16, 16Kx1/2Kx8, 16Kx1/4Kx4, 16Kx1/8Kx2, 16Kx1/16Kx1
- RAM1K18 also has a two-port mode. In this case, Port A will become the read port and Port B becomes the write port.
- In two-port mode, each port can be independently configured to any of the following depth/width: 512x36, 512x32, 1Kx18, 1Kx16, 2Kx9, 2Kx8, 4Kx4, 8Kx2 and 16Kx1.
- The widths of each port can be different, but one needs to be a multiple of the other. There are 45 unique combinations of two-port aspect ratios:
 - 512x36/512x36, 512x36/1Kx18, 512x36/2Kx9,
 - 512x32/512x32, 512x32/1Kx16, 512x32/2Kx8, 512x32/4Kx4, 512x32/8Kx2, 512x32/16Kx1,
 - 1Kx18/512x36, 1Kx18/1Kx18, 1Kx18/2Kx9,
 - 1Kx16/512x32, 1Kx16/1Kx16, 1Kx16/2Kx8, 1Kx16/4Kx4, 1Kx16/8Kx2, 1Kx16/16Kx1,
 - 2Kx9/512x36, 2Kx9/1Kx18, 2Kx9/2Kx9,
 - 2Kx8/512x32, 2Kx8/1Kx16, 2Kx8/2Kx8, 2Kx8/4Kx4, 2Kx8/8Kx2, 2Kx8/16Kx1,
 - 4Kx4/512x32, 4Kx4/1Kx16, 4Kx4/2Kx8, 4Kx4/4Kx4, 4Kx4/8Kx2, 4Kx4/16Kx1,
 - 8Kx2/512x32, 8Kx2/1Kx16, 8Kx2/2Kx8, 8Kx2/4Kx4, 8Kx2/8Kx2, 8Kx2/16Kx1,

- 16Kx1/512x32, 16Kx1/1Kx16, 16Kx1/2Kx8, 16Kx1/4Kx4, 16Kx1/8Kx2, 16Kx1/16Kx1
- RAM1K18 performs synchronous operation for setting up the address as well as writing and reading the data. The address, data, block port select and write-enable inputs are registered.
- An optional pipeline register with a separate enable, synchronous-reset and asynchronous-reset is available at the read data port to improve the clock-to-out delay.
- There is an independent clock for each port. The memory will be triggered at the rising edge of the clock.
- The true dual-port mode supports an optional feed-through write mode, where the write data also appears on the corresponding read data port.
- Read from both ports at the same location is allowed.
- Read and write on the same location at the same time results in unknown data to be read. **There is no collision prevention or detection.** However, correct data is expected to be written into the memory.

Figure 58 shows a simplified block diagram of the RAM1K18 memory block and Table 6 gives the port descriptions.

The simplified block diagram illustrates the two independent data ports, the pipeline registers, and the feed-through multiplexors.

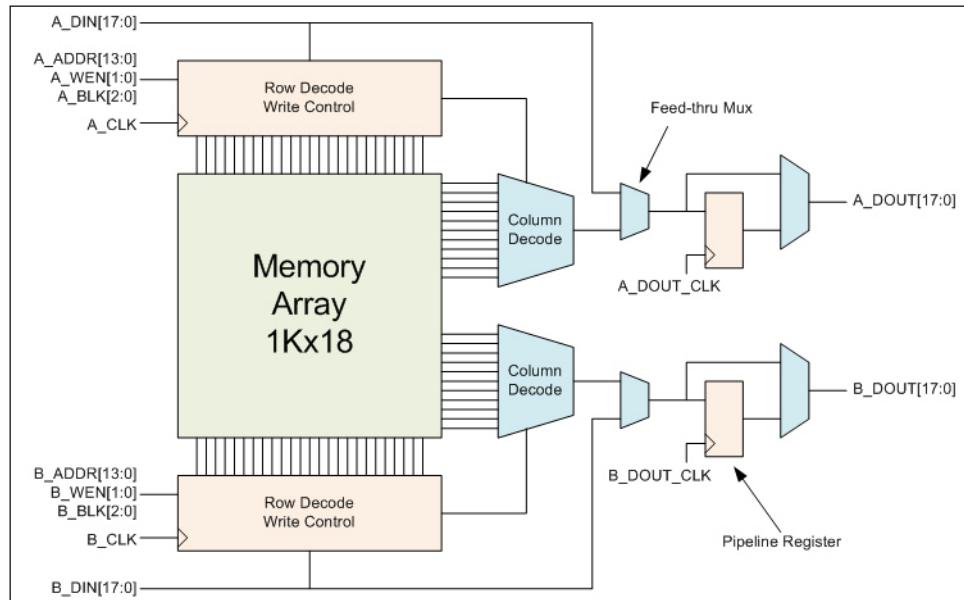

Figure 58 • Simplified Block Diagram of RAM1K18

Table 6 • Port RAM List for RAM1K18

Pin Name	Pin Direction	Type1	Description	Polarity
A_ADDR[13:0]	Input	Dynamic	Port A address	
A_BLK[2:0]	Input	Dynamic	Port A block selects	High
A_CLK	Input	Dynamic	Port A clock	Rising
A_DIN[17:0]	Input	Dynamic	Port A write data	
A_DOUT[17:0]	Output	Dynamic	Port A read data	

Table 6 • Port RAM List for RAM1K18

Pin Name	Pin Direction	Type1	Description	Polarity
A_WEN[1:0]	Input	Dynamic	Port A write enables (per byte)	High
A_WIDTH[2:0]	Input	Static	Port A width/depth mode select	
A_WMODE	Input	Static	Port A feed-through write select	High
A_ARST_N	Input	Dynamic	Port A reset (must be tied to 1)	Low
A_DOUT_LAT	Input	Static	Port A pipeline register select	Low
A_DOUT_ARST_N	Input	Dynamic	Port A pipeline register asynchronous reset	Low
A_DOUT_CLK	Input	Dynamic	Port A pipeline register clock (must be tied to A_CLK or 1)	Rising
A_DOUT_EN	Input	Dynamic	Port A pipeline register enable	High
A_DOUT_SRST_N	Input	Dynamic	Port A pipeline register synchronous reset	Low
<hr/>				
B_ADDR[13:0]	Input	Dynamic	Port B address	
B_BLK[2:0]	Input	Dynamic	Port B block selects	High
B_CLK	Input	Dynamic	Port B clock	Rising
B_DIN[17:0]	Input	Dynamic	Port B write data	
B_DOUT[17:0]	Output	Dynamic	Port B read data	
B_WEN[1:0]	Input	Dynamic	Port B write enables (per byte)	High
B_WIDTH[2:0]	Input	Static	Port B width/depth mode select	
B_WMODE	Input	Static	Port B Feed-through write select	High
B_ARST_N	Input	Dynamic	Port B reset (must be tied to 1)	Low
B_DOUT_LAT	Input	Static	Port B pipeline register select	Low
B_DOUT_ARST_N	Input	Dynamic	Port B pipeline register asynchronous reset	Low
B_DOUT_CLK	Input	Dynamic	Port B pipeline register clock (must be tied to B_CLK or 1)	Rising
B_DOUT_EN	Input	Dynamic	Port B pipeline register enable	High
B_DOUT_SRST_N	Input	Dynamic	Port B pipeline register synchronous reset	Low
<hr/>				
A_EN	Input	Static	Port A power down (must be tied to 1)	Low
B_EN	Input	Static	Port B power down (must be tied to 1)	Low
SII_LOCK	Input	Static	Lock access to SII	High
BUSY	Output	Dynamic	Busy signal from SII	High

Note: Static inputs are defined at design time and need to be tied to 0 or 1.

Signal Descriptions for RAM1K18

A_WIDTH and B_WIDTH

Table 7 lists the width/depth mode selections for each port. Two-port mode is in effect when the width of at least one port is 36, and A_WIDTH indicates the read width while B_WIDTH indicates the write width. Also, when the write width is 36, the read width must also be 36.

Table 7 • Width/Depth Mode Selection

Depth x Width	A_WIDTH/B_WIDTH
16Kx1	000
8Kx2	001
4Kx4	010
2Kx8, 2Kx9	011
1Kx16, 1Kx18	100
512x32, 512x36 (Two-port)	101 11x

A_WEN and B_WEN

Table 8 lists the write/read control signals for each port. Two-port mode is in effect when the width of at least one port is 36, and read operation is always enabled. Also, when the write width is 36, both A_WEN and B_WEN must be static.

Table 8 • Write/Read Operation Select

Depth x Width	A_WEN/B_WEN	Result
16Kx1, 8Kx2, 4Kx4, 2Kx8, 2Kx9, 1Kx16, 1Kx18	00	Perform a read operation
16Kx1, 8Kx2, 4Kx4, 2Kx8, 2Kx9	01	Perform a write operation
1Kx16	01	Write [7:0]
	10	Write [16:9]
	11	Write [16:9], [7:0]
1Kx18	01	Write [8:0]
	10	Write [17:9]
	11	Write [17:0]

Table 8 • Write/Read Operation Select

Depth x Width	A_WEN/B_WEN	Result
512x32 (Two-port write)	B_WEN[0] = 1	Write B_DIN[7:0]
	B_WEN[1] = 1	Write B_DIN[16:9]
	A_WEN[0] = 1	Write A_DIN[7:0]
	A_WEN[1] = 1	Write A_DIN[16:9]
512x36 (Two-port write)	B_WEN[0] = 1	Write B_DIN[8:0]
	B_WEN[1] = 1	Write B_DIN[17:9]
	A_WEN[0] = 1	Write A_DIN[8:0]
	A_WEN[1] = 1	Write A_DIN[17:9]

A_ADDR and B_ADDR

Table 9 address buses for the two ports. Fourteen bits are needed to address the 16K independent locations in x1 mode. In wider modes, fewer address bits are used. The required bits are MSB justified and unused LSB bits must be tied to 0. A_ADDR is synchronized by A_CLK while B_ADDR is synchronized to B_CLK. Two-port mode is in effect when the width of at least one port is 36, and A_ADDR provides the read address while B_ADDR provides the write address.

Table 9 • Address Bus Used and Unused Bits

Depth x Width	A_ADDR/B_ADDR	
	Used Bits	Unused Bits (must be tied to 0)
16Kx1	[13:0]	None
8Kx2	[13:1]	[0]
4Kx4	[13:2]	[1:0]
2Kx8, 2Kx9	[13:3]	[2:0]
1Kx16, 1Kx18	[13:4]	[3:0]
512x32, 512x36 (Two-port)	[13:5]	[4:0]

A_DIN and B_DIN

Table 10 lists the data input buses for the two ports. The required bits are LSB justified and unused MSB bits must be tied to 0. Two-port mode is in effect when the width of at least one port is 36, and A_DIN provides the MSB of the write data while B_DIN provides the LSB of the write data.

Table 10 • Data Input Buses Used and Unused Bits

Depth x Width	A_DIN/B_DIN	
	Used Bits	Unused Bits (must be tied to 0)
16Kx1	[0]	[17:1]
8Kx2	[1:0]	[17:2]
4Kx4	[3:0]	[17:4]
2Kx8	[7:0]	[17:8]
2Kx9	[8:0]	[17:9]
1Kx16	[16:9] is [15:8] [7:0] is [7:0]	[17] [8]
1Kx18	[17:0]	None
512x32 (Two-port write)	A_DIN[16:9] is [31:24] A_DIN[7:0] is [23:16] B_DIN[16:9] is [15:8] B_DIN[7:0] is [7:0]	A_DIN[17] A_DIN[8] B_DIN[17] B_DIN[8]
512x36 (Two-port write)	A_DIN[17:0] is [35:18] B_DIN[17:0] is [17:0]	None

A_DOUT and B_DOUT

Table 11 lists the data output buses for the two ports. The required bits are LSB justified. Two-port mode is in effect when the width of at least one port is 36, and A_DOUT provides the MSB of the read data while B_DOUT provides the LSB of the read data.

Table 11 • Data Output Buses Used and Unused Bits

Depth x Width	A_DOUT/B_DOUT	
	Used Bits	Unused Bits
16Kx1	[0]	[17:1]
8Kx2	[1:0]	[17:2]
4Kx4	[3:0]	[17:4]
2Kx8	[7:0]	[17:8]
2Kx9	[8:0]	[17:9]
1Kx16	[16:9] is [15:8] [7:0] is [7:0]	[17] [8]
1Kx18	[17:0]	None

Table 11 • Data Output Buses Used and Unused Bits

Depth x Width	A_DOUT/B_DOUT	
	Used Bits	Unused Bits
512x32 (Two-port read)	A_DOUT[16:9] is [31:24] A_DOUT[7:0] is [23:16] B_DOUT[16:9] is [15:8] B_DOUT[7:0] is [7:0]	A_DOUT[17] A_DOUT[8] B_DOUT[17] B_DOUT[8]
512x36 (Two-port read)	A_DOUT[17:0] is [35:18] B_DOUT[17:0] is [17:0]	None

A_BLK and B_BLK

Table 12 lists the block port select control signals for the two ports. A_BLK is synchronized by A_CLK while B_BLK is synchronized to B_CLK. Two-port mode is in effect when the width of at least one port is 36, and A_BLK controls the read operation while B_BLK controls the write operation

Table 12 • Block Port Select

Block Port Select Signal	Value	Result
A_BLK[2:0]	111	Perform read or write operation on Port A. In 36 width mode, perform a read operation from both ports A and B
A_BLK[2:0]	Any one bit is 0	No operation in memory from Port A. Port A read data will be forced to 0. In 36 width mode, the read data from both ports A and B will be forced to 0.
B_BLK[2:0]	111	Perform read or write operation on Port B. In 36 width mode, perform a write operation to both ports A and B.
B_BLK[2:0]	Any one bit is 0	No operation in memory from Port B. Port B read data will be forced to 0, unless it is a 36 width mode and write operation to both ports A and B is gated.

A_WMODE and B_WMODE

In true dual-port write mode, each port has a feed-through write option:

- Logic 0 = Read data port holds the previous value.
- Logic 1 = Feed-through, i.e. write data appears on the corresponding read data port. This setting is invalid when the width of at least one port is 36 and the two-port mode is in effect.

A_CLK and B_CLK

All signals in ports A and B are synchronous to the corresponding port clock. All address, data, block port select and write enable inputs must be set up before the rising edge of the clock. The read or write operation begins with the rising edge. Two-port mode is in effect when the width of at least one port is 36, and A_CLK provides the read clock while B_CLK provides the write clock.

A_DOUT_LAT and B_DOUT_LAT

A_DOUT_CLK and B_DOUT_CLK

A_DOUT_ARST_N and B_DOUT_ARST_N

A_DOUT_EN and B_DOUT_EN

A_DOUT_SRST_N and B_DOUT_SRST_N

The A_DOUT_LAT and B_DOUT_LAT signals select the pipeline registers for the respective port. Two-port mode is in effect when the width of at least one port is 36, and the A_DOUT register signals control the MSB of the read data while the B_DOUT register signals control the LSB of the read data.

The pipeline registers have rising edge clock inputs for each port, which must be tied to the respective port clock when used. When the pipeline registers are not being used, they are forced into latch mode and the clock signals should be tied to 1, which makes them transparent.

[Table 13](#) describes the functionality of the control signals on the A_DOUT and B_DOUT pipeline registers.

Table 13 • Truth Table for A_DOUT and B_DOUT Registers

<u>_ARST_N</u>	<u>_LAT</u>	<u>_CLK</u>	<u>_EN</u>	<u>_SRST_N</u>	D	Q_{n+1}
0	X	X	X	X	X	0
1	0	Not rising	X	X	X	Q _n
1	0	↑	0	X	X	Q _n
1	0	↑	1	0	X	0
1	0	↑	1	1	D	D
1	1	0	X	X	X	Q _n
1	1	1	0	X	X	Q _n
1	1	1	1	0	X	0
1	1	1	1	1	D	D

A_EN and B_EN

These are active low, power down configuration bits for each port. They must be tied to 1.

A_ARST_N and B_ARST_N

Always tie these signals to 1.

SII_LOCK

Control signal, when 1 locks the entire RAM1K18 memory from being accessed by the SII.

BUSY

This output indicates that the RAM1K18 memory is being accessed by the SII.

RAM64x18

The RAM64x18 block contains 1,152 memory bits and is a three-port memory providing one write port and two read ports. Write operations to the RAM64x18 memory are synchronous. Read operations can be asynchronous or synchronous for either setting up the address and/or reading out the data. Enabling synchronous operation at the read address port improves setup timing for the read address and its enable signals. Enabling synchronous operation at the read data port improves clock-to-out delay. Each data port on the RAM64x18 memory can be independently configured in any combination shown below.

- 64x18, 64x16
- 128x9, 128x8
- 256x4
- 512x2
- 1Kx1

The main features of the RAM64x18 memory block are as follows

- There are two independent read data ports A and B, and one write data port C.
- The write operation is always synchronous. The write address, write data, C block port select and write enable inputs are registered.
- For both read data ports, setting up the address can be synchronous or asynchronous.
- The two read data ports have address registers with a separate enable, synchronous-reset and asynchronous-reset for synchronous mode operation, which can also be configured to be transparent latches for asynchronous mode operation.
- The two read data ports have output registers with a separate enable, synchronous-reset and asynchronous-reset for pipeline mode operation, which can also be configured to be transparent latches for asynchronous mode operation.
- Therefore, there are four read operation modes for ports A and B:
 - Synchronous read address without pipeline registers (sync-async)
 - Synchronous read address with pipeline registers (sync-sync)
 - Asynchronous read address without pipeline registers (async-async)
 - Asynchronous read address with pipeline registers (async-sync)
- Each data port on the RAM64x18 memory can be independently configured in any of the following combinations: 64x18, 64x16, 128x9, 128x8, 256x4, 512x2, and 1Kx1.
- The widths of each port can be different, but they need to be multiples of one another.
- There is an independent clock for each port. The memory will be triggered at the rising edge of the clock.
- Read from both ports A and B at the same location is allowed.
- Read and write on the same location at the same time results in unknown data to be read. **There is no collision prevention or detection.** However, correct data is expected to be written into the memory.

Figure 59 shows a simplified block diagram of the RAM64x18 memory block and Table 14 gives the port descriptions.

The simplified block diagram illustrates the three independent read/write ports and the pipeline registers on the read port.

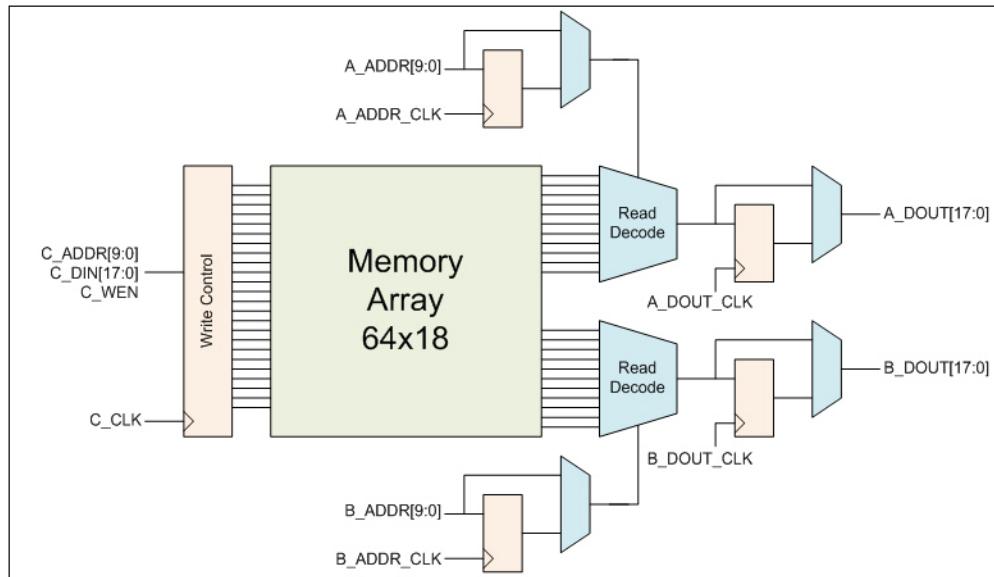

Figure 59 • Simplified Block Diagram of RAM64x18

Table 14 • Port List for RAM64x18

Pin Name	Pin Direction	Type1	Description	Polarity
A_ADDR[9:0]	Input	Dynamic	Port A address	
A_BLK[1:0]	Input	Dynamic	Port A block selects	High
A_WIDTH[2:0]	Input	Static	Port A width/depth mode selection	
A_DOUT[17:0]	Output	Dynamic	Port A read data	
A_DOUT_ARST_N	Input	Dynamic	Port A pipeline register asynchronous reset	Low
A_DOUT_CLK	Input	Dynamic	Port A pipeline register clock	Rising
A_DOUT_EN	Input	Dynamic	Port A pipeline register enable	High
A_DOUT_LAT	Input	Static	Port A pipeline register select	Low
A_DOUT_SRST_N	Input	Dynamic	Port A pipeline register synchronous reset	Low
A_ADDR_CLK	Input	Dynamic	Port A address register clock	Rising
A_ADDR_EN	Input	Dynamic	Port A address register enable	High
A_ADDR_LAT	Input	Static	Port A address register select	Low
A_ADDR_SRST_N	Input	Dynamic	Port A address register synchronous reset	Low
A_ADDR_ARST_N	Input	Dynamic	Port A address register asynchronous reset	Low

Table 14 • Port List for RAM64x18

Pin Name	Pin Direction	Type1	Description	Polarity
B_ADDR[9:0]	Input	Dynamic	Port B address	
B_BLK[1:0]	Input	Dynamic	Port B block selects	High
B_WIDTH[2:0]	Input	Static	Port B width/depth mode selection	
B_DOUT[17:0]	Output	Dynamic	Port B read data	
B_DOUT_ARST_N	Input	Dynamic	Port B pipeline register asynchronous reset	Low
B_DOUT_CLK	Input	Dynamic	Port B pipeline register clock	Rising
B_DOUT_EN	Input	Dynamic	Port B pipeline register enable	High
B_DOUT_LAT	Input	Static	Port B pipeline register select	Low
B_DOUT_SRST_N	Input	Dynamic	Port B pipeline register synchronous reset	Low
B_ADDR_CLK	Input	Dynamic	Port B address register clock	Rising
B_ADDR_EN	Input	Dynamic	Port B address register enable	High
B_ADDR_LAT	Input	Static	Port B address register select	Low
B_ADDR_SRST_N	Input	Dynamic	Port B address register synchronous reset	Low
B_ADDR_ARST_N	Input	Dynamic	Port B address register asynchronous reset	Low
C_ADDR[9:0]	Input	Dynamic	Port C address	
C_CLK	Input	Dynamic	Port C clock	Rising
C_DIN[17:0]	Input	Dynamic	Port C write data	
C_WEN	Input	Dynamic	Port C write enable	High
C_BLK[1:0]	Input	Dynamic	Port C block selects	High
C_WIDTH[2:0]	Input	Static	Port C width/depth mode selection	
A_EN	Input	Static	Port A power down (must be tied to 1)	Low
B_EN	Input	Static	Port B power down (must be tied to 1)	Low
C_EN	Input	Static	Port C power down (must be tied to 1)	Low
SII_LOCK	Input	Static	Lock access to SII	High
BUSY	Output	Dynamic	Busy signal from SII	High

Note: Static inputs are defined at design time and need to be tied to 0 or 1.

Signal Descriptions for RAM64x18

A_WIDTH, B_WIDTH and C_WIDTH

Table 15 lists the width/depth mode selections for each port.

Table 15 • Width/Depth Mode Selection

Depth x Width	A_WIDTH/B_WIDTH/C_WIDTH
1Kx1	000
512x2	001
256x4	010
128x8, 128x9	011
64x16, 64x18	1xx

C_WEN

This is the write enable signal for port C.

A_ADDR, B_ADDR and C_ADDR

Table 16 lists the address buses for each port. 10 bits are required to address 1K independent locations in x1 mode. In wider modes, fewer address bits are used. The required bits are MSB justified and unused LSB bits must be tied to 0.

Table 16 • Address Buses Used and Unused Bits

Depth x Width	A_ADDR/B_ADDR/C_ADDR	
	Used Bits	Unused Bits (must be tied to zero)
1Kx1	[9:0]	None
512x2	[9:1]	[0]
256x4	[9:2]	[1:0]
128x8, 128x9	[9:3]	[2:0]
64x16, 64x18	[9:4]	[3:0]

C_DIN

Table 17 lists the write data input for port C. The required bits are LSB justified and unused MSB bits must be tied to 0.

Table 17 • Data Input Bus Used and Unused Bits

Depth x Width	C_DIN	
	Used Bits	Unused Bits (must be tied to 0)
1Kx1	[0]	[17:1]
512x2	[1:0]	[17:2]
256x4	[3:0]	[17:4]
128x8	[7:0]	[17:8]
128x9	[8:0]	[17:9]
64x16	[16:9] [7:0]	[17] [8]
64x18	[17:0]	None

A_DOUT and B_DOUT

Table 18 lists the read data output buses for ports A and B. The required bits are LSB justified.

Table 18 • Data Output Used and Unused Bits

Depth x Width	A_DOUT/B_DOUT	
	Used Bits	Unused Bits
1Kx1	[0]	[17:1]
512x2	[1:0]	[17:2]
256x4	[3:0]	[17:4]
128x8	[7:0]	[17:8]
128x9	[8:0]	[17:9]
64x16	[16:9] [7:0]	[17] [8]
64x18	[17:0]	None

A_BLK, B_BLK and C_BLK

Table 19 lists the block port select control signals for the ports.

Table 19 • Block Port Select

Block Port Select Signal	Value	Result
A_BLK[1:0]	Any one bit is 0	Port A is not selected and its read data will be forced to zero.
	11	Perform read operation from port A.
B_BLK[1:0]	Any one bit is 0	Port B is not selected and its read data will be forced to zero.
	11	Perform read operation from port B.
C_BLK[1:0]	Any one bit is 0	Port C is not selected.
	11	Perform write operation to port C.

C_CLK

All signals on port C are synchronous to this clock signal. All write address, write data, C block port select and write enable inputs must be set up before the rising edge of the clock. The write operation begins with the rising edge.

A_DOUT_LAT, A_ADDR_LAT, B_DOUT_LAT and B_ADDR_LAT

A_DOUT_CLK, A_ADDR_CLK, B_DOUT_CLK and B_ADDR_CLK

A_DOUT_ARST_N, A_ADDR_ARST_N, B_DOUT_ARST_N and B_ADDR_ARST_N

A_DOUT_EN, A_ADDR_EN, B_DOUT_EN and B_ADDR_EN

A_DOUT_SRST_N, A_ADDR_SRST_N, B_DOUT_SRST_N and B_ADDR_SRST_N

The _LAT signals select the registers for the respective port.

The address and pipeline registers have rising edge clock inputs for ports A and B. When both the address and pipeline registers for a port are in use, their clock signals must be tied together. When the registers are not being used, they are forced into latch mode and the clock signals should be tied to 1, which makes them transparent.

Table 20 describes the functionality of the control signals on the A_ADDR, B_ADDR, A_DOUT and B_DOUT registers.

Table 20 • Truth Table for A_ADDR, B_ADDR, A_DOUT and B_DOUT Registers

<u>_ARST_N</u>	<u>_LAT</u>	<u>_CLK</u>	<u>_EN</u>	<u>_SRST_N</u>	D	Q_{n+1}
0	X	X	X	X	X	0
1	0	Not rising	X	X	X	Q_n
1	0	↑	0	X	X	Q_n
1	0	↑	1	0	X	0
1	0	↑	1	1	D	D
1	1	0	X	X	X	Q_n
1	1	1	0	X	X	Q_n
1	1	1	1	0	X	0
1	1	1	1	1	D	D

A_EN, B_EN and C_EN

Active low, power down configuration bits for each port. They must be tied to 1.

SII_LOCK

Control signal, when 1 locks the entire RAM64X18 memory from being accessed by the SII.

BUSY

Output indicates that the RAM64X18 memory is being accessed by the SII.

MACC

18 bit x 18 bit multiply-accumulate MACC block

The MACC block can accumulate the current multiplication product with a previous result, a constant, a dynamic value, or a result from another MACC block. Each MACC block can also be configured to perform a Dot-product operation. All the signals of the MACC block (except CDIN and CDOUT) have optional registers.

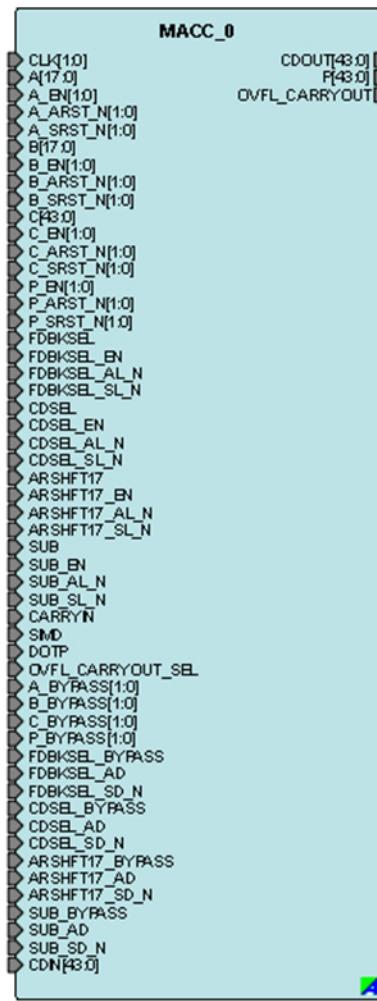

Figure 60 • MACC Ports

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
DOTP	Input	Static	High	Dot-product mode. When DOTP = 1, MACC block performs Dot-product of two pairs of 9-bit operands. When DOTP = 0, it is called the normal mode.
SIMD	Input	Static		Reserved. Must be 0.
CLK[1:0]	Input	Dynamic	Rising edge	<p>Input clocks.</p> <ul style="list-style-type: none"> • CLK[1] is the clock for A[17:9], B[17:9], C[43:18], P[43:18], OVFL_CARRYOUT, ARSHFT17, CDSEL, FDBKSEL and SUB registers. • CLK[0] is the clock for A[8:0], B[8:0], C[17:0], CARRYIN and P[17:0]. <p>In normal mode, ensure CLK[1] = CLK[0].</p>
A[17:0]	Input	Dynamic	High	Input data A.
A_BYPASS[1:0]	Input	Static	High	<p>Bypass data A registers.</p> <ul style="list-style-type: none"> • A_BYPASS[1] is for A[17:9]. Connect to 1, if not registered. • A_BYPASS[0] is for A[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure A_BYPASS[0] = A_BYPASS[1].</p>
A_ARST_N[1:0]	Input	Dynamic	Low	<p>Asynchronous reset for data A registers.</p> <ul style="list-style-type: none"> • A_ARST_N[1] is for A[17:9]. Connect to 1, if not registered. • A_ARST_N[0] is for A[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure A_ARST_N[1] = A_ARST_N[0].</p>
A_SRST_N[1:0]	Input	Dynamic	Low	<p>Synchronous reset for data A registers.</p> <ul style="list-style-type: none"> • A_SRST_N[1] is for A[17:9]. Connect to 1, if not registered. • A_SRST_N[0] is for A[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure A_SRST_N[1] = A_SRST_N[0].</p>

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
A_EN[1:0]	Input	Dynamic	High	<p>Enable for data A registers.</p> <ul style="list-style-type: none"> • A_EN[1] is for A[17:9]. Connect to 1, if not registered. • A_EN[0] is for A[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure A_EN[1] = A_EN[0].</p>
B[17:0]	Input	Dynamic	High	Input data B.
B_BYPASS[1:0]	Input	Static	High	<p>Bypass data B registers.</p> <ul style="list-style-type: none"> • B_BYPASS[1] is for B[17:9]. Connect to 1, if not registered. • B_BYPASS[0] is for B[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure B_BYPASS[0] = B_BYPASS[1].</p>
B_ARST_N[1:0]	Input	Dynamic	Low	<p>Asynchronous reset for data B registers.</p> <ul style="list-style-type: none"> • B_ARST_N[1] is for B[17:9]. Connect to 1, if not registered. • B_ARST_N[0] is for B[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure B_ARST_N[1] = B_ARST_N[0].</p>
B_SRST_N[1:0]	Input	Dynamic	Low	<p>Synchronous reset for data B registers.</p> <ul style="list-style-type: none"> • B_SRST_N[1] is for B[17:9]. Connect to 1, if not registered. • B_SRST_N[0] is for B[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure B_SRST_N[1] = B_SRST_N[0].</p>
B_EN[1:0]	Input	Dynamic	High	<p>Enable for data B registers.</p> <ul style="list-style-type: none"> • B_EN[1] is for B[17:9]. Connect to 1, if not registered. • B_EN[0] is for B[8:0]. Connect to 1, if not registered. <p>In normal mode, ensure B_EN[1] = B_EN[0].</p>

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
P[43:0]	Output		High	<p>Result data. Normal mode</p> <ul style="list-style-type: none"> • $P = D + (\text{CARRYIN} + C) + (A * B)$, when SUB = 0 • $P = D + (\text{CARRYIN} + C) - (A * B)$, when SUB = 1 <p>Dot-product mode</p> <ul style="list-style-type: none"> • $P = D + (\text{CARRYIN} + C) + 512 * ((A_L * B_H) + (A_H * B_L))$, when SUB = 0 • $P = D + (\text{CARRYIN} + C) - 512 * ((A_L * B_H) + (A_H * B_L))$, when SUB = 1 <p>Notation:</p> <ul style="list-style-type: none"> • $A_L = A[8:0]$, $A_H = A[17:9]$ • $B_L = B[8:0]$, $B_H = B[17:9]$ <p>Refer to Table 24 on page 70 to see how operand D is obtained from P, CDIN or 0.</p>
OVFL_CARRYOUT	Output		High	<p>Overflow or CarryOut</p> <ul style="list-style-type: none"> • Overflow when OVFL_CARRYOUT_SEL = 0 $\text{OVFL_CARRYOUT} = (\text{SUM}[45] \wedge \text{SUM}[44]) (\text{SUM}[44] \wedge \text{SUM}[43])$ • CarryOut when OVFL_CARRYOUT_SEL = 1 $\text{OVFL_CARRYOUT} = C[43] \wedge D[43] \wedge \text{SUM}[44]$
P_BYPASS[1:0]	Input	Static	High	<p>Bypass result P registers.</p> <ul style="list-style-type: none"> • P_BYPASS[1] is for P[43:18] and OVFL_CARRYOUT. Connect to 1, if not registered. • P_BYPASS[0] is for P[17:0]. Connect to 1, if not registered. <p>In normal mode, ensure $P_BYPASS[0] = P_BYPASS[1]$.</p>
P_ARST_N[1:0]	Input	Dynamic	Low	<p>Asynchronous reset for result P registers.</p> <ul style="list-style-type: none"> • P_ARST_N[1] is for P[43:18] and OVFL_CARRYOUT. Connect to 1, if not registered. • P_ARST_N[0] is for P[17:0]. Connect to 1, if not registered. <p>In normal mode, ensure $P_ARST_N[1] = P_ARST_N[0]$.</p>

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
P_SRST_N[1:0]	Input	Dynamic	Low	<p>Synchronous reset for result P registers.</p> <ul style="list-style-type: none"> • P_SRST_N[1] is for P[43:18] and OVFL_CARRYOUT. Connect to 1, if not registered. • P_SRST_N[0] is for P[17:0]. Connect to 1, if not registered. <p>In normal mode, ensure P_SRST_N[1] = P_SRST_N[0].</p>
P_EN[1:0]	Input	Dynamic	High	<p>Enable for result P registers.</p> <ul style="list-style-type: none"> • P_EN[1] is for P[43:18] and OVFL_CARRYOUT. Connect to 1, if not registered. • P_EN[0] is for P[17:0]. Connect to 1, if not registered. <p>In normal mode, ensure P_EN[1] = P_EN[0].</p>
CDOU[43:0]	Output	Cascade	High	<p>Cascade output of result P.</p> <p>CDOU is the same as P. The entire bus must either be dangling or drive an entire CDIN of another MACC block in cascaded mode.</p>
CARRYIN	Input	Dynamic	High	CarryIn for operand C.
C[43:0]	Input	Dynamic	High	<p>Routed input for operand C.</p> <p>In Dot-product mode, connect C[8:0] to the CARRYIN.</p>
C_BYPASS[1:0]	Input	Static	High	<p>Bypass data C registers.</p> <ul style="list-style-type: none"> • C_BYPASS[1] is for C[43:18]. Connect to 1, if not registered. • C_BYPASS[0] is for C[17:0] and CARRYIN. Connect to 1, if not registered. <p>In normal mode, ensure C_BYPASS[0] = C_BYPASS[1].</p>
C_ARST_N[1:0]	Input	Dynamic	Low	<p>Asynchronous reset for data C registers.</p> <ul style="list-style-type: none"> • C_ARST_N[1] is for C[43:18]. Connect to 1, if not registered. • C_ARST_N[0] is for C[17:0] and CARRYIN. Connect to 1, if not registered. <p>In normal mode, ensure C_ARST_N[1] = C_ARST_N[0].</p>

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
C_SRST_N[1:0]	Input	Dynamic	Low	<p>Synchronous reset for data C registers.</p> <ul style="list-style-type: none"> • C_SRST_N[1] is for C[43:18]. Connect to 1, if not registered. • C_SRST_N[0] is for C[17:0] and CARRYIN. Connect to 1, if not registered. <p>In normal mode, ensure C_SRST_N[1] = C_SRST_N[0].</p>
C_EN[1:0]	Input	Dynamic	High	<p>Enable for data C registers.</p> <ul style="list-style-type: none"> • C_EN[1] is for C[43:18]. Connect to 1, if not registered. • C_EN[0] is for C[17:0] and CARRYIN. Connect to 1, if not registered. <p>In normal mode, ensure C_EN[1] = C_EN[0].</p>
CDIN[43:0]	Input	Cascade	High	<p>Cascaded input for operand D. The entire bus must be driven by an entire CDOUT of another MACC block. In Dot-product mode the CDOUT must also be generated by a MACC block in Dot-product mode.</p> <p>Refer to Table 24 on page 70 to see how CDIN is propagated to operand D.</p>
ARSHFT17	Input	Dynamic	High	<p>Arithmetic right-shift for operand D. When asserted, a 17-bit arithmetic right-shift is performed on operand D going into the accumulator.</p> <p>Refer to Table 24 on page 70 to see how operand D is obtained from P, CDIN or 0.</p>
ARSHFT17_BYPASS	Input	Static	High	Bypass ARSHFT17 register. Connect to 1, if not registered.
ARSHFT17_AL_N	Input	Dynamic	Low	<p>Asynchronous load for ARSHFT17 register. Connect to 1, if not registered.</p> <p>When asserted, ARSHFT17 register is loaded with ARSHFT17_AD.</p>
ARSHFT17_AD	Input	Static	High	Asynchronous load data for ARSHFT17 register.
ARSHFT17_SL_N	Input	Dynamic	Low	Synchronous load for ARSHFT17 register. Connect to 1, if not registered. See Table 22 on page 69 .
ARSHFT17_SD_N	Input	Static	Low	Synchronous load data for ARSHFT17 register. See Table 22 on page 69 .
ARSHFT17_EN	Input	Dynamic	High	Enable for ARSHFT17 register. Connect to 1, if not registered. See Table 22 on page 69 .

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
CDSEL	Input	Dynamic	High	Select CDIN for operand D. When CDSEL = 1, propagate CDIN. When CDSEL = 0, propagate 0 or P depending on FDBKSEL. Refer to Table 22 on page 69 to see how operand D is obtained from P, CDIN or 0.
CDSEL_BYPASS	Input	Static	High	Bypass CDSEL register. Connect to 1, if not registered.
CDSEL_AL_N	Input	Dynamic	Low	Asynchronous load for CDSEL register. Connect to 1, if not registered. When asserted, CDSEL register is loaded with CDSEL_AD.
CDSEL_AD	Input	Static	High	Asynchronous load data for CDSEL register.
CDSEL_SL_N	Input	Dynamic	Low	Synchronous load for CDSEL register. Connect to 1, if not registered. See Table 22 on page 69 .
CDSEL_SD_N	Input	Static	Low	Synchronous load data for CDSEL register. See Table 22 on page 69 .
CDSEL_EN	Input	Dynamic	High	Enable for CDSEL register. Connect to 1, if not registered. See Table 22 on page 69 .
<hr/>				
FDBKSEL	Input	Dynamic	High	Select the feedback from P for operand D. When FDBKSEL = 1, propagate the current value of result P register. Ensure P_BYPASS[1] = 0 and CDSEL = 0. When FDBKSEL = 0, propagate 0. Ensure CDSEL = 0. Refer to Table 24 on page 70 to see how operand D is obtained from P, CDIN or 0.
FDBKSEL_BYPASS	Input	Static	High	Bypass FDBKSEL register. Connect to 1, if not registered.
FDBKSEL_AL_N	Input	Dynamic	Low	Asynchronous load for FDBKSEL register. Connect to 1, if not registered. When asserted, FDBKSEL register is loaded with FDBKSEL_AD.
FDBKSEL_AD	Input	Static	High	Asynchronous load data for FDBKSEL register.
FDBKSEL_SL_N	Input	Dynamic	Low	Synchronous load for FDBKSEL register. Connect to 1, if not registered. See Table 22 on page 69 .
FDBKSEL_SD_N	Input	Static	Low	Synchronous load data for FDBKSEL register. See Table 22 on page 69 .
FDBKSEL_EN	Input	Dynamic	High	Enable for FDBKSEL register. Connect to 1, if not registered. See Table 22 on page 69 .
<hr/>				

Table 21 • Ports

Port Name	Direction	Type	Polarity	Description
SUB	Input	Dynamic	High	Subtract operation.
SUB_BYPASS	Input	Static	High	Bypass SUB register. Connect to 1, if not registered.
SUB_AL_N	Input	Dynamic	Low	Asynchronous load for SUB register. Connect to 1, if not registered. When asserted, SUB register is loaded with SUB_AD.
SUB_AD	Input	Static	High	Asynchronous load data for SUB register.
SUB_SL_N	Input	Dynamic	Low	Synchronous load for SUB register. Connect to 1, if not registered. See Table 22 .
SUB_SD_N	Input	Static	Low	Synchronous load data for SUB register. See Table 22 .
SUB_EN	Input	Dynamic	High	Enable for SUB register. Connect to 1, if not registered. See Table 22 .

Table 22 • Truth Table for Control Registers ARSHFT17, CDSEL, FDBKSEL and SUB

_AL_N	_AD	_BYPASS	_CLK	_EN	_SL_N	_SD_N	D	Q_{n+1}
0	AD	X	X	X	X	X	X	AD

Table 24 • Truth Table - Propagating Data to Operand D

FDBKSEL	CDSEL	ARSHFT17	Operand D
0	0	x	44'b0
x	1	0	CDIN[43:0]
x	1	1	{{17{CDIN[43]}},CDIN[43:17]}
1	0	0	P[43:0]
1	0	1	{{17{P[43]}},P[43:17]}

A – Product Support

Microsemi SoC Products Group backs its products with various support services, including Customer Service, Customer Technical Support Center, a website, electronic mail, and worldwide sales offices. This appendix contains information about contacting Microsemi SoC Products Group and using these support services.

Customer Service

Contact Customer Service for non-technical product support, such as product pricing, product upgrades, update information, order status, and authorization.

From North America, call 800.262.1060

From the rest of the world, call 650.318.4460

Fax, from anywhere in the world, 650.318.8044

Customer Technical Support Center

Microsemi SoC Products Group staffs its Customer Technical Support Center with highly skilled engineers who can help answer your hardware, software, and design questions about Microsemi SoC Products. The Customer Technical Support Center spends a great deal of time creating application notes, answers to common design cycle questions, documentation of known issues, and various FAQs. So, before you contact us, please visit our online resources. It is very likely we have already answered your questions.

Technical Support

Visit the Customer Support website (www.microsemi.com/soc/support/search/default.aspx) for more information and support. Many answers available on the searchable web resource include diagrams, illustrations, and links to other resources on the website.

Website

You can browse a variety of technical and non-technical information on the SoC home page, at www.microsemi.com/soc.

Contacting the Customer Technical Support Center

Highly skilled engineers staff the Technical Support Center. The Technical Support Center can be contacted by email or through the Microsemi SoC Products Group website.

Email

You can communicate your technical questions to our email address and receive answers back by email, fax, or phone. Also, if you have design problems, you can email your design files to receive assistance. We constantly monitor the email account throughout the day. When sending your request to us, please be sure to include your full name, company name, and your contact information for efficient processing of your request.

The technical support email address is soc_tech@microsemi.com.

My Cases

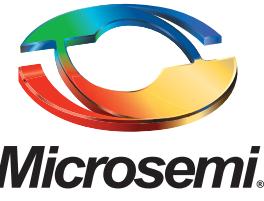

Microsemi SoC Products Group customers may submit and track technical cases online by going to [My Cases](#).

Outside the U.S.

Customers needing assistance outside the US time zones can either contact technical support via email (soc_tech@microsemi.com) or contact a local sales office. [Sales office listings](#) can be found at www.microsemi.com/soc/company/contact/default.aspx.

ITAR Technical Support

For technical support on RH and RT FPGAs that are regulated by International Traffic in Arms Regulations (ITAR), contact us via soc_tech_itar@microsemi.com. Alternatively, within [My Cases](#), select **Yes** in the ITAR drop-down list. For a complete list of ITAR-regulated Microsemi FPGAs, visit the [ITAR](#) web page.

Microsemi Corporate Headquarters

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor solutions for: aerospace, defense and security; enterprise and communications; and industrial and alternative energy markets. Products include high-performance, high-reliability analog and RF devices, mixed signal and RF integrated circuits, customizable SoCs, FPGAs, and complete subsystems. Microsemi is headquartered in Aliso Viejo, Calif. Learn more at www.microsemi.com.
