Customer Notification No: CN19010

Subject

Libero SoC Timing Change and IO Glitch Notification

CAN 19010.1 Clock Source Latency Calculation

Description of the Issue

Due to an error introduced in Libero SoC v11.7-SP1, when a clock source latency constraint is applied to a generated clock, an additional delay (= late – early) is incorrectly added to the net driven by the clock source and impacting the required time calculation. As a result, the clock source latency constraint is ignored on the generated clock. Up until Libero SoC v12.0, this constraint has been recommended as a way to capture clock jitter information and pass it on to be used by the static timing analysis tool, SmartTime, during its Max Delay Analysis.

Reason for Notification

Libero SoC v11.9 SP2 and beyond restores the correct value for the data required time calculation. This correction is also addressed in Libero SoC v12.0. The respective software release notes include a reference to this change. In addition, starting with Libero SoC v12.0, jitter can also be modeled using simple clock uncertainty constraints.

Application Impact

Starting with Libero SoC v11.7 SP1 to v11.9 SP1, a clock source latency constraint set on a generated clock to capture, for example, internal PLL output jitter may have shown no timing violations in SmartTime that a proper accounting for the jitter might have flagged. There is no timing risk issue for cases where the slack of the max delay path is greater than the total jitter window (late-to-early value). However, if such slack is less than the jitter window, there is a risk for a timing violation that the tool would have not flagged in the affected versions. See Table 283 in the SmartFusion2/IGLOO2 datasheet for jitter specifications.

Action Required

Re-run static timing analysis with SmartTime using Libero SoC v11.9 SP2 or later, if you are setting a clock source latency constraint on a generated clock and the margin you have is less than the constraint window (for example, jitter window).

CAN 19010.2 IO Glitches During Auto-Update

Description of Change

Auto-update is a method to automatically update the FPGA image on a power-up. If enabled, the system controller will check the design version of a bitstream in an external SPI flash and compare it to the programmed version. If the external bitstream is newer than the programmed bitstream, then the system controller will use the new bitstream to program the device. If auto-update is enabled, an auto-update action will occur. Under these conditions during device power-up or the de-assertion of DEVRST_N, an IO glitch will occur on banks 0, 1, and 2 of the the M2S005/010/025 or M2GL005/010/025 devices. If auto-update is not enabled, the glitch does not occur. The amplitude of the glitch correlates to the VDDI bank voltage level.

Reason for Notification

IO glitches on banks 0, 1, and 2 of the the M2S005/010/025 or M2GL005/010/025 devices during auto-update programming mode.

Application Impact

The IO glitch is a drive-high glitch with <10 ns duration. The glitch occurs before the FPGA user IOs are activated and the FPGA fabric comes out of reset. Note that DEVRST_N is not needed for proper device operation. DEVRST_N resets the system controller effectively causing a warm boot of the device. Users should always use a GPIO to perform a user design reset.

Workaround

- Utilize In-Application Programming (IAP) in place of auto-update.
- Move sensitive outputs to a non-glitch bank.

Contact Information

If you have further questions about this subject, contact Microsemi Technical Support department by using the support portal at <https://soc.microsemi.com/Portal/Default.aspx>

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.

Microsemi, a wholly owned subsidiary of Microchip Technology Inc. (Nasdaq: MCHP), offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions; security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.
