### II. TOTAL IONIZING DOSE (TID) TESTING

This testing is designed on the base of an extensive database (see, for example, TID data of antifuse-based FPGA in <http://www.klabs.org/> and <http://www.actel.com/>) accumulated from the TID testing of many generations of antifuse-based FPGAs. One distinctive quality about this testing is the bench measurement of electrical parameters. Compared to an automatic-tester measurement, the bench measurement provides lower noise, better accuracy and flexibility. The bench measurement samples pins for the measurements. However, two factors make sampling appropriate: first, the tolerance is often determined by either the  $I_{CC}$  or propagation delay, both are global parameters; second, the total dose effect is uniformly distributed across the chip.

#### A. Device-Under-Test (DUT) and Irradiation Parameters

Table 1 lists the DUT and irradiation parameters. During irradiation each input and most of the output is grounded through a 100k-ohm resistor; during annealing each input or output is tied to the ground or  $V_{CC1}$  with a 2.7-k ohm resistor. Appendix A contains the schematics of the irradiation-bias circuit.

## B. Test Method

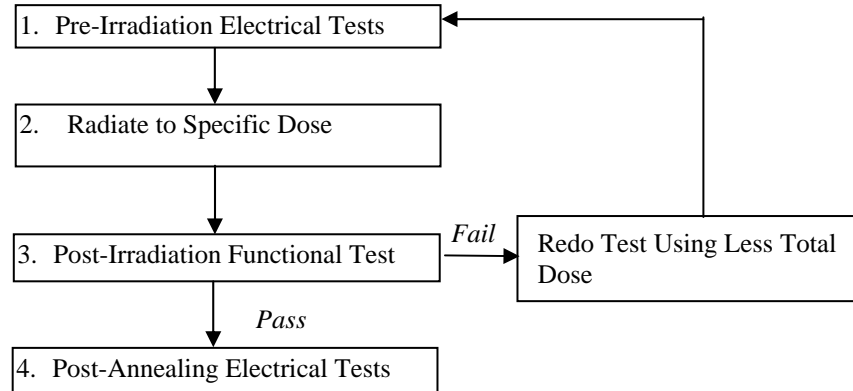

Figure 1 Parametric test flow chart

The test method generally follows the guidelines in the military standard TM1019. Figure 1 is the flow chart showing the steps for parametric tests, irradiation, and post-irradiation annealing.

The accelerated aging, or rebound test mentioned in TM1019 is unnecessary because there is no adverse time dependent effect (TDE) in products manufactured by sub-micron CMOS technology. Elevated temperature annealing reduces the effects originated from radiation-induced leakages. As indicated by testing data in the following sections, the predominant radiation effects in RTAX2000S are due to radiation-induced leakages.

Room temperature annealing is performed in this test; the duration is approximately 14 days.

## C. Design and Parametric Measurements

DUTs use a high utilization generic design (RTAX2000S\_TID) to test total dose effects in typical space applications. Appendix B contains the schematics and Verilog files for the logic design.

Table 2 lists each electrical parameter to be measured and the corresponding logic design. The functionality is measured on the output pin (O\_BS) of a combinational buffer-string with 14,000 buffers, output pins (O\_ANDP\_CLKF, O\_ORP\_CLKF, O\_FF\_CLKF, O\_ANDC\_CLKF, O\_ORC\_CLKF, O\_ANDP\_CLKG, O\_ORP\_CLKG, O\_FF\_CLKG, O\_ANDC\_CLKG, O\_ORC\_CLKG, O\_ANDP\_CLKH, O\_ORP\_CLKH, O\_FF\_CLKH, O\_ANDC\_CLKH, O\_ORC\_CLKH, O\_ANDP\_HCLKA, O\_ORP\_HCLKA, O\_FF\_HCLKA, O\_ANDC\_HCLKA, and O\_ORC\_HCLKA) of four (4) shift registers with 10,728 bits total, and half of the output pins (OUTX0, OUTX1, OUTX2, OUTX3, OUTX4, OUTX5, OUTX6 and OUTX7) of the embedded RAM configured as 16k×16.

$I_{CC}$  is measured on the power supply of the logic-array ( $I_{CCA}$ ) and I/O ( $I_{CCI}$ ) respectively. The input logic threshold ( $V_{IL}/V_{IH}$ ) is measured on single-ended inputs EN8, DA, IO\_I1, IO\_I2, IO\_I3, IO\_I4, IO\_I5 and IO\_I6, and also on differential inputs DIO\_I1P, DIO\_I2P, DIO\_I3P, DIO\_I4P, DIO\_I5P, DIO\_I6P and DIO\_I7P. The differential inputs are configured as LVPECL instead of LVDS. Because LVPECL uses 3.3 VDC, which is higher than 2.5 VDC used by LVDS, it is the worst case among the differential pairs. During the measurement on the differential inputs, the N (negative) side of the differential pair is biased at 1.8 V. The output-drive voltage ( $V_{OL}/V_{OH}$ ) is measured on QA0. The propagation delay is measured on the output (O\_BS) of the buffer string. The definition is the time delay from the triggering edge at the CLOCK input to the switching edge at the output O\_BS. Both the delays of low-to-high and high-to-low output transitions are measured; the reported delay is the average of these two measurements. The transition characteristics, measured on the output O\_BS, are shown as oscilloscope snapshots.

#### A. Functionality

Every DUT passed the pre-irradiation and post-annealing functional tests.
