The modular ultra precision XLi Time and Frequency System is the most versatile and flexible solution for timing and synchronization requirements. The XLi modularity with its wide variety of easily configured option cards is complemented by a generous collection of standard timing outputs/inputs. Leveraging a wide range of option cards makes it easy to tailor your system to support nearly every possible output/input needed for time and frequency applications by combining up to ten option modules (2U chassis), oscillator upgrades, and two GPS receivers per unit.

Configuration recognition software automatically detects the unit’s setup, without modifications to the operating system, providing “plug-and-play” configuration capability for current and future application needs. Modularity delivers the freedom to configure the XLi as a GPS timing instrument, or as a time code unit (TCU). Deploy the Microsemi® GPS technology to generate ultra high precision time and frequency outputs for a wide range of synchronization requirements, or leverage Microsemi’s years of expertise in Time Code technology, which is built into the heart of the XLi system.

The versatile range of timing signals available coupled with oscillator choices enables the XLi to excel in a broad variety of mission critical applications including mobile and satellite communications, military and defense, power utilities, metrology and broadcasting.

The XLi seamlessly integrates into a network centric environment with its standard network interface. Remote management is facilitated with the intuitive web based interface as well as monitoring via SNMP with an enterprise MIB. A command line interface is supported via Telnet or the RS-232/422 serial port for local or remote management and system integration. With the addition of the NTS option the XLi functions as a Stratum 1 NTP server.

The standard XLi provides an unmatched range of time and frequency inputs/outputs such as: 1PPS output; time code input/output (IRIG A, B; IEEE 1344; NASA36) in both modulated [AM] and demodulated [DCLS] formats; pulse rates; auxiliary reference input; open collector alarm; front panel keypad and display; and more. From there the modularity allows for further customization.

The modular XLi architecture allows easy extension of the software and hardware in the field. Software updates are remotely administered. Existing and future hardware option modules can be added as needed by the user.

**NETWORK TIME SERVER ON STANDARD NETWORK PORT**

- Synchronize servers and workstations across the network
- Robust NTP capability
- High availability time referenced to XLi
- MD5 security protocol
- NTP broadcast mode
- SNMP Enterprise MIB
- Stratum 1 operation via GPS satellites

The NTS distributes time to precisely synchronize client computer clocks over a network. Time is acquired from the host XLi and distributed over the network using the Network Time Protocol (NTP). Client computer clocks can be synchronized within milliseconds. Information on the health and status of the NTP server and the primary time synchronization source is available by using the SNMP protocol Enterprise MIB. Also, MD5 security protocol is included to authenticate NTP client-server communication. The standard network port, when factory enabled, serves as the NTP server via an RJ-45 Ethernet connector. No additional hardware is needed for this option; it utilizes the XLi standard network port, leaving all option slots available.

**SPECIFICATIONS: NETWORK TIME SERVER OPTION 87-8017**

**NETWORK PROTOCOLS**

**CLIENT SOFTWARE**

An NTP client_daemon is required for client-side synchronization with any network time server. Comprehensive time client, server & management software for easy distribution, management and monitoring of time across the network is also available.

**PROGRAMMABLE PULSE OUTPUT**

The Programmable Pulse Output option is a software option that provides a user configurable TTL level pulse output that can be used to supply a precisely synchronized “trigger” pulse at specific times or provide periodic pulse outputs. The rising edge of the trigger output may be programmed with microsecond resolution for fine control. The periodic pulse rates support several popular frequencies such as 1 PPS, 1 PP 10 SEC, 1 PPM, 1 PP 10 MIN, 1 PPH, 1 PP 10 HR, 1 PPD, 1 PP 10 DAYS or 1 PP 100 DAYS. The pulse width is also programmable. The pulse is supplied via a rear panel BNC.

**SPECIFICATIONS: PROGRAMMABLE PULSE OUTPUT (PPO) 87-8024**

- Range: 500kHz to 1 PP Year (integer multiples of 1 uS)
- Pulse width: Programmable in 1μS steps up to 1 year

**FREQUENCY MEASUREMENT**

The Frequency Measurement is a software option that provides the ability to precisely measure the frequency of an externally applied 1, 5, or 10 MHz signal. Measurement resolution is better than 120 x 10^-12 with only a 1-second averaging time. It supports a periodic, zero dead-time mode of operation as well as a single-shot, measurement-on-demand mode. The measurement interval can be specified in integer seconds over the range of 1 to 100,000 seconds. Frequency measurement results appear on the front panel display and are output via the communication port.

**TIME INTERVAL/EVENT TIMING**

**TIME INTERVAL**
The Time Interval function is a software option that provides the user with the ability to precisely measure the interval between the time of occurrence of the clock-derived 1 Hz reference pulse and the rising edge of the user-supplied 1 Hz pulse.

**EVENT TIMING**
The Event Timing feature offers the capability of locating the time of occurrence of the rising edge of the applied pulse with respect to the time of year. A "burst" mode provides increased performance during short intervals. The collected data is available via the RS-232 or the Telnet port.

**OSCILLATORS**
Microsemi’s GPS receiver takes full advantage of the excellent long-term stability of the GPS system to steer or "discipline" the receiver’s local oscillator. This process dramatically enhances performance by removing the long term aging and drift of the oscillator without operator intervention.

Microsemi provides a full spectrum of ultra-precise frequency reference standards for every application. Upgrades to the XLI standard Temperature Compensated Voltage Controlled Crystal Oscillator (TCVCXO) are the Ovenized Crystal Oscillator (OCXO), High Stability Ovenized Crystal Oscillator (OCXO), Rubidium Oscillator, and the High Stability Rubidium Oscillator.

For all oscillators the accuracy is a function of the input synchronization source (GPS, IRIG, 1PPS, Have Quick).

FREQUENCY AND TIME DEVIATION MONITOR (FTM)

This plug-in card meets the specific needs of the electrical power industry by providing a digital display and computer-compatible outputs of the following parameters:

- **Frequency Deviation** – The instantaneous difference between the locally generated frequency (typically 50 or 60 Hz) and the precision frequency of the host Synchronized Clock.
- **System Frequency** – The user's locally generated frequency.
- **Time Deviation** – The accumulated difference in time between a clock locked to the locally generated frequency and the precise time of the Synchronized Clock.
- **System Time** – (Hours, minutes and seconds) as defined by a clock running off the user's locally generated frequency.
