Purpose

This application note explains how to access an elliptic curve cryptography (ECC) service in the SmartFusion[®]2 system-on-chip (SoC) field programmable gate array (FPGA) devices.

Introduction

ECC is a public key encryption technique based on the elliptic curve theory. ECC is used to encrypt and is based on a one-way property in which it is easy to perform a calculation, but not feasible to invert the results of the calculation to find the original numbers.

ECC is used:

- In implementing faster, smaller size, and efficient cryptographic keys.
- In digital signatures through elliptic curve digital signature algorithm (ECDSA) and in key exchange through elliptic curve diffie-hellman (ECDH).

ECC feature is available in the larger SmartFusion2 devices such as: M2S090TS and M2S150TS. ECC has two mathematical services such as: scalar point multiplication and point addition, based on the national institute of standards and technology (NIST) recommended P-384 elliptic curve domain parameters.

In the SmartFusion2 SoC FPGA devices, ECC services are accessible through the system services. The system services are system controller actions initiated by asynchronous events from the ARM[®] Cortex[®]-M3 processor or a fabric master in the SmartFusion2 device. ECC is used for data and design security applications.

This application note provides a design example to implement and access the following ECC services:

- ECC point addition
- Scalar point multiplication
- Generate public key

System Controller Block in SmartFusion2 Device

The ECC services provide access to the system controller's ECC core. The ECC Core block is accessed through the communication block (COMM_BLK).

There are two COMM_BLK instances:

- Located in the MSS
- Located in the system controller

The COMM_BLK consists an APB interface, eight byte transmits FIFO, and eight byte receives FIFO. The COMM_BLK provides a bi-directional message passing facility between the microcontroller subsystem (MSS) and system controller.

The ECC system services are initiated using the COMM_BLK in the MSS, which can be read or written by any master on the AMBA® high performance bus (AHB) matrix; typically either the Cortex-M3 processor or a design in the FPGA fabric (also known as a fabric master).

The system controller receives the command through the COMM_BLK in the system controller. On completion of the requested service, the system controller returns a status message through the COMM_BLK. The responses are generated based on the selected command.

Figure 1 shows the system controller block in the SmartFusion2 device.

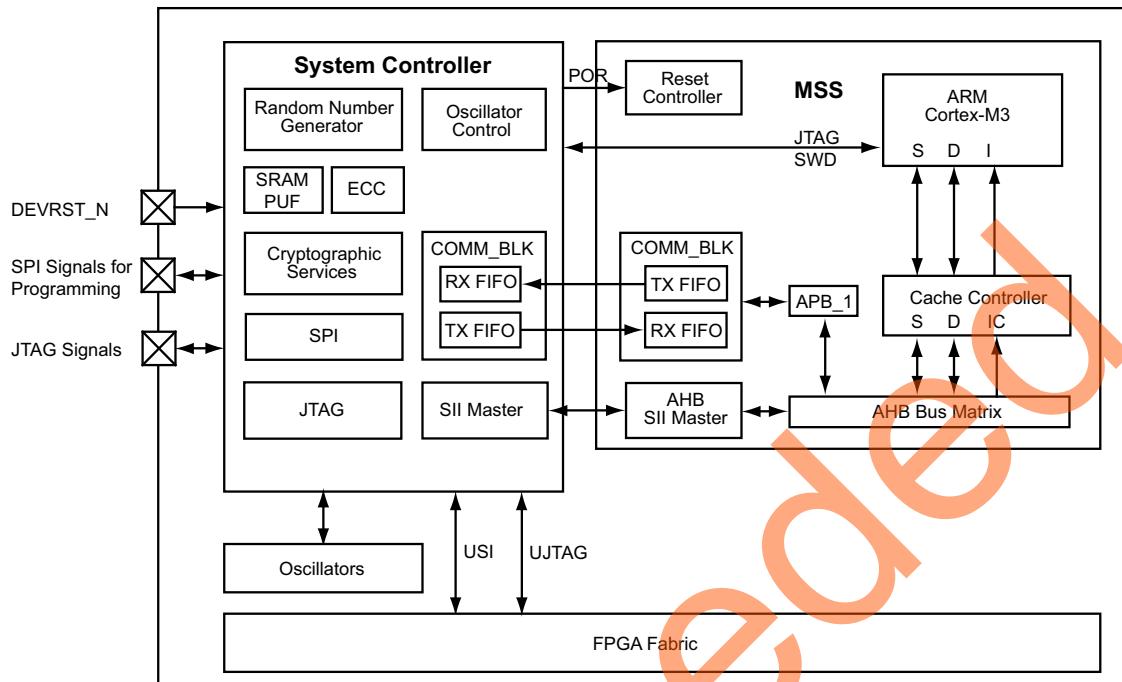

Figure 1 • System Controller Block in the SmartFusion2 Device

For more information about system controller, refer to the [UG0450: SmartFusion2 SoC FPGA and IGLOO2 FPGA System Controller User Guide](#).

For more information about "COMM_BLK", refer to the "Communication Block" chapter in the [UG0331: SmartFusion2 Microcontroller Subsystem User Guide](#).

ECC and Services

An elliptic curve is defined as the set of points (X, Y), which satisfy an elliptic curve equation of the form:

$$Y^2 = X^3 + aX + b;$$

EQ 1

Where a and b are the elements of a finite field with p^n ($n = 192, 224, 256$, or 384), where p is a prime number larger than 3. An example of the Elliptical curve is shown in [Figure 2](#).

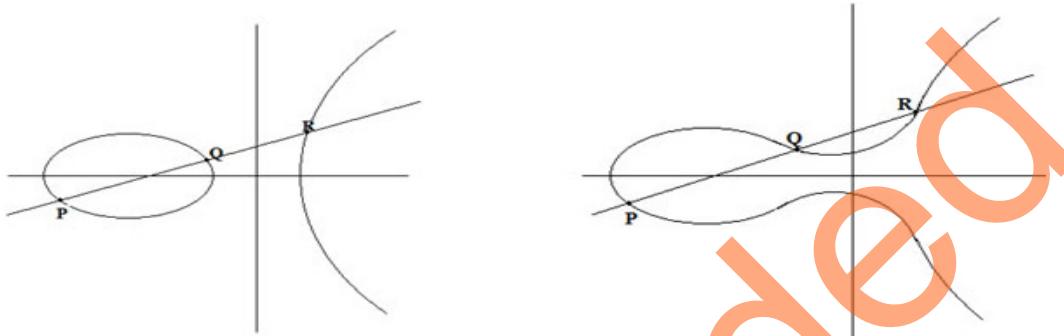

Figure 2 • Elliptical Curves

If X^3+aX+b contains no repeated factors, or equivalently if $4a^3+27b^2$ is not 0 (zero), then the elliptic curve $Y^2 = X^3 + aX + b$ can be used to form a group.

The elliptic curve groups are additive groups.

This application note uses NIST recommended P-384 curve to implement the ECC system services. The domain parameters for the curve P-384 are the prime, a, b, and base point G. The recommended values for these parameters are:

The Prime $P^{384} = 2^{384} - 2^{128} - 2^{96} + 2^{32} - 1$:

In hexadecimal form:

$p_{384} = \text{ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff}$
 $00000000 00000000 \text{ffffffffff}$

The parameter a in hexadecimal form:

$a = \text{ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff ffffffff}$
 $00000000 00000000 \text{ffffffffff}$

The parameter b in hexadecimal form:

$b = \text{b3312fa7 e23ee7e4 988e056b e3f82d19 181d9c6e fe814112}$
 $0314088f 5013875a c656398d 8a2ed19d 2a85c8ed d3ec2aef$

The base point G in hexadecimal form:

$G_x = \text{aa87ca22 be8b0537 8eb1c71e f320ad74 6e1d3b62 8ba79b98}$
 $59f741e0 82542a38 5502f25d bf55296c 3a545e38 72760aB7}$
 $G_y = \text{3617de4a 96262c6f 5d9e98bf 9292dc29 f8f41dbd 289a147c}$
 $e9da3113 b5f0b8c0 0a60b1ce 1d7e819d 7a431d7c 90ea0e5F}$

The following ECC services are implemented in this application note:

Point Addition

The elliptic point addition service adds two points according to the definition of elliptic curve point addition. The inputs are two points (x, y), each lying on the P-384 curve and the resulting point (x, y), which is guaranteed to be on the curve.

Point addition service computes the results as the following:

$$R(R_x, R_y) = P(P_x, P_y) + Q(Q_x, Q_y)$$

P and Q are two 384 bit input points (P_x, P_y) and (Q_x, Q_y) on the P-384 elliptic curve.

In order to add the points P and Q, a line is drawn through the two points. This line intersects the elliptic curve in exactly one more point, call -R. The point -R is reflected in the x-axis to the point R. The law for addition in an elliptic curve group is $P + Q = R$, where R is the result of addition, as shown in Figure 3.

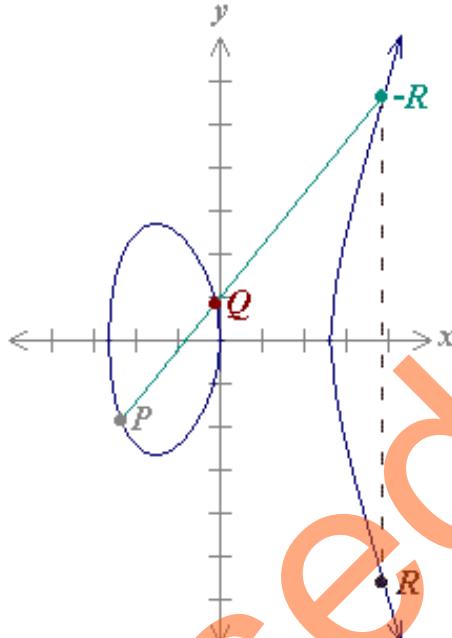

Figure 3 • Addition on an Elliptic Curve

The example input points P and Q are provided in this application note for P-384 elliptic curve, you can enter any P and Q points on the curve to perform the addition operation.

Note: Input points are not tested for validity by the ECC. If an input point is not a valid point on the P-384 curve (including the point at infinity), then the result will be undefined and no warning message are displayed. You can find NIST recommended input test vectors at the following location:

<http://csrc.nist.gov/groups/STM/cavp/documents/components/ecccdhtestvectors.zip>.

Table 1 shows the command value to perform the ECC Point Addition in the SmartFusion2 device.

Table 1 • ECC Point Addition

| System Service Name | Command Value | Response Status |
|---------------------|---------------|---|
| Point Addition | 17 | 0: Success completion 127: HRESP error occurred during MSS transfer 253: License not available in device 254: Service disabled by factory security 255: Service disabled by user security |

Scalar Point Multiplication

The scalar point multiplication service multiplies the scalar point with the point on the P-384 curve.

The multiplication service computes the result as per the standard:

$$Q = d \times P$$

d is the scalar input (384 bit) and P is the 384 bit point (P_x, P_y) on the curve.

Table 2 shows the command value to perform the ECC point multiplication.

Table 2 • ECC Point Multiplication

| System Service Name | Command Value | Response Status |
|----------------------|---------------|---|
| Point Multiplication | 16 | 0: Success completion 127: HRESP error occurred during MSS transfer 253: License not available in device 254: Service disabled by factory security 255: Service disabled by user security |

Generating a Public Key

The point multiplication is used for generating a public key with provided private key (384 bit integer). The domain parameter G, specifies the base point on the curve P-384 to use. This domain base point is built into hardware accelerator, which has a special form of the scalar multiplication command that uses base point without the user having to enter.

The generated public key is used further to encrypt the data or an application. The data or the application can be decrypted using the private key.

Design Requirements

Table 3 shows the design requirements.

Table 3 • Design Requirements

| Design Requirements | Description |
|--|-------------------------------------|
| Hardware Requirements | |
| SmartFusion2 Security Evaluation Kit <ul style="list-style-type: none"> • 12 V adapter • FlashPro4 programmer • USB A to Mini-B cable | Rev D or later |
| Host PC or Laptop | Any 64-bit Windows Operating System |
| Software Requirements | |
| Libero® System-on-Chip (SoC) | v11.6 |
| SoftConsole | v3.4 SP1 |
| FlashPro Programming Software | v11.6 |
| USB to UART drivers | - |

Design Description

The design is implemented on the SmartFusion2 Security Evaluation Kit board using M2S090TS-1FGG484 device.

The design example consists:

- RC oscillator
- Fabric CCC
- CORERESET
- MSS

The fabric PLL provides the base clock for the MSS. The system services are run using various C routine in the MSS, as shown in the following sections. In addition, a universal asynchronous receiver/transmitter (UART1) in the MSS displays the operation of the ECC system service.

Hardware Implementation

Figure 4 shows a block diagram of the design example. The RC oscillator generates a 50 MHz input clock and the fabric PLL generates a 100 MHz clock from the RC oscillator. The 100 MHz clock is used as the base clock for the MSS.

The MMUART_1 signals are used to communicate with the serial terminal program.

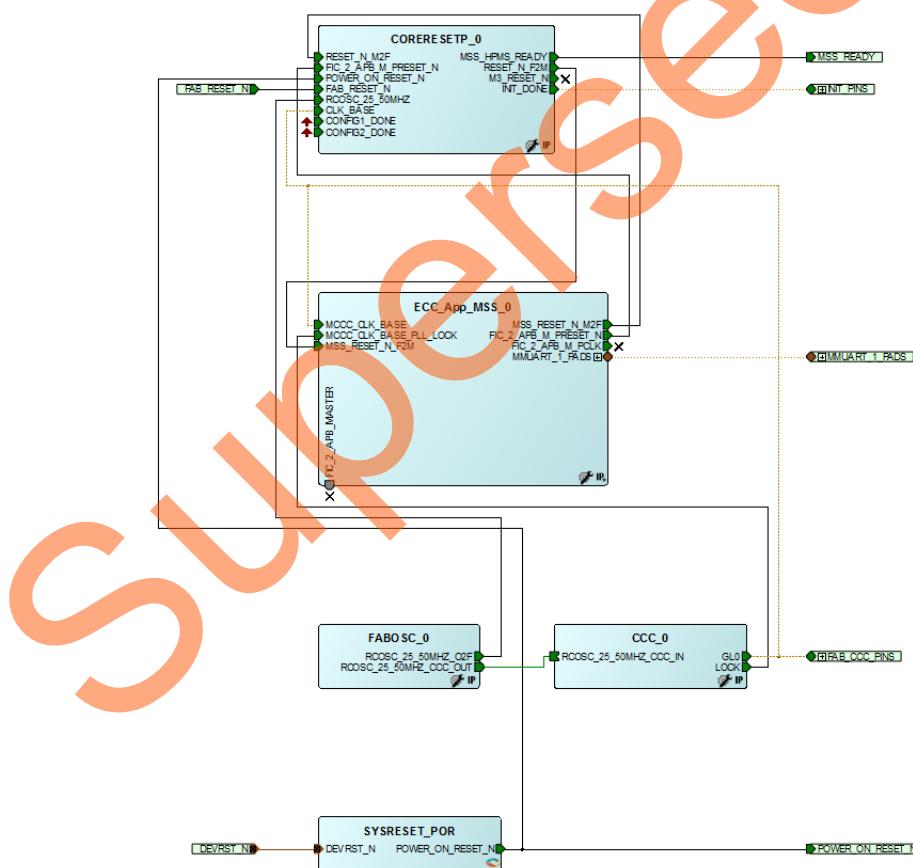

Figure 4 • Block Diagram of SmartFusion2 ECC Design Example

Software Implementation

The software design example performs the following operations:

- ECC point addition
- Scalar point multiplication
- Public key generation

Firmware Drivers

The following firmware drivers are used in this application:

- MSS MMUART driver: Communicates with the serial terminal program on the host PC.
- MSS System Services driver: Provides access to the SmartFusion2 system services.

List of APIs

The following APIs in [Table 4](#) are used in software design to access the ECC Services.

Table 4 • APIs to Access the ECC System Services

| API | Description |
|------------------------------------|-----------------------------|
| MSS_SYS_ecc_point_addition() | Point addition |
| MSS_SYS_ecc_point_multiplication() | Scalar point multiplication |
| MSS_SYS_ecc_get_base_point() | To get base point |

Setting Up the Design

The following steps describe how to set up the design:

1. Plug the FlashPro4 ribbon cable to the **J5** connector (JTAG Programming Header) on the SmartFusion2 Security Evaluation Kit board.
2. Connect the mini USB cable between the FlashPro4 and the USB port of the host PC.
3. Connect the power supply to the **J6** connector.
4. Connect the Host PC to the **J18** connector using the USB min-B cable.
5. Ensure that the USB to UART bridge drivers are automatically detected. This can be verified in the Device Manager.

Figure 5 shows the example device manager window. If USB to UART bridge drivers are not installed, download and install the drivers from:

www.microsemi.com/soc/documents/CDM_2.08.24_WHQL_Certified.zip

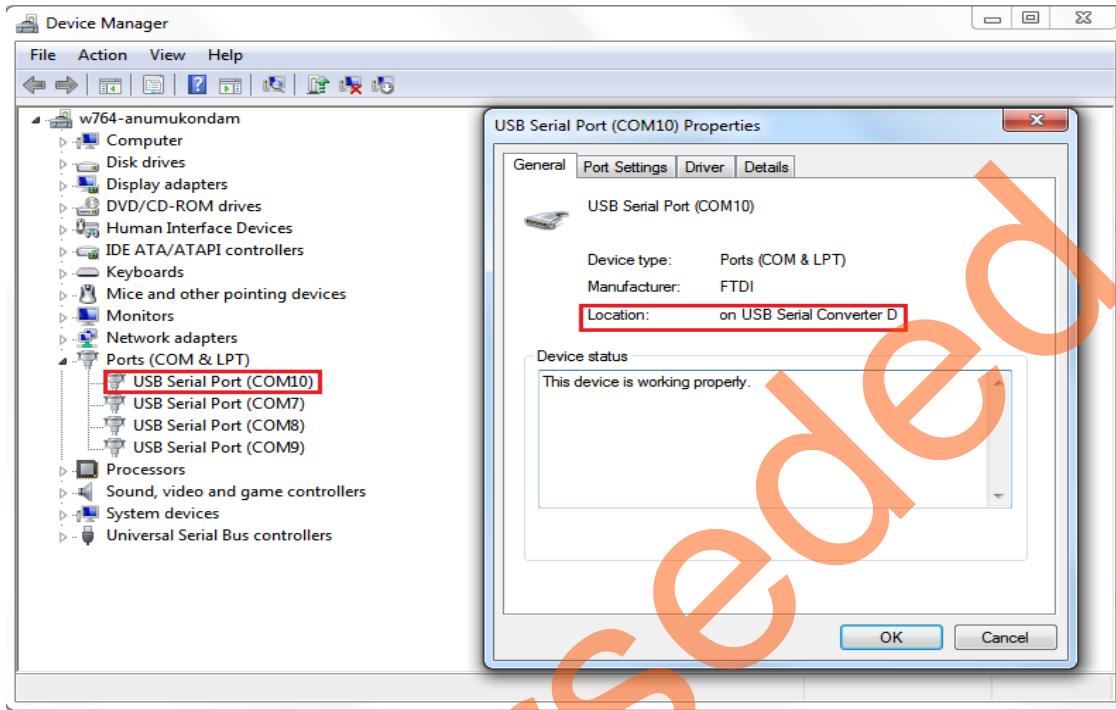

Figure 5 • Device Manager Window

6. Connect the jumpers on the SmartFusion2 Security Evaluation Kit, as shown in Table 5.

Note: Ensure that power supply switch SW7 is switched OFF while connecting the jumpers on the SmartFusion2 Security Evaluation Kit.

Table 5 • SmartFusion2 Security Evaluation Kit Jumper Settings

| Jumper | Pin (From) | Pin (To) | Comments |
|--------|------------|----------|----------|
| J22 | 1 | 2 | Default |
| J23 | 1 | 2 | Default |
| J24 | 1 | 2 | Default |
| J8 | 1 | 2 | Default |
| J3 | 1 | 2 | Default |

Figure 6 shows the board setup for running the ECC services design on the SmartFusion2 Security Evaluation Kit.

Figure 6 • SmartFusion2 Security Evaluation Kit

Running the Design

The following steps describes how to run the design on the SmartFusion2 Security Evaluation Kit board using the M2S090TS-1FGG484 device:

1. Switch ON the power supply switch, **SW7**.
2. Start a PuTTY or HyperTerminal session with 115200 baud rate, 8 data bits, 1 stop bit, no parity, and no flow control. Use any free serial terminal emulation program such as: HyperTerminal or TeraTerm, if the computer does not have the PuTTY program. For more information about configuring HyperTerminal, TeraTerm, or PuTTY, refer to the [Configuring Serial Terminal Emulation Programs Tutorial](#).
3. Program the SmartFusion2 Security Evaluation Kit board with the provided STAPL file using the FlashPro4 programmer. Refer to "[Appendix A: Design and Programming Files](#)" on page 21" for more information.

4. After programming, HyperTerminal displays a message to run the ECC Services as shown in Figure 7.

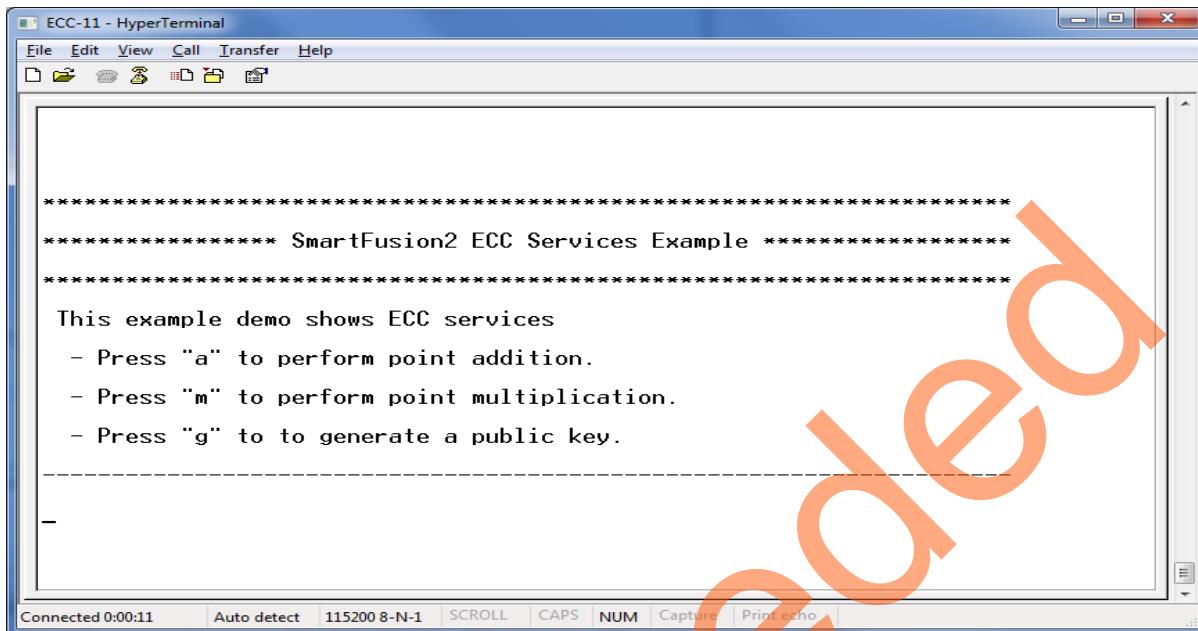

Figure 7 • Welcome Message

1. Enter **a** to perform point addition. HyperTerminal displays "Enter the X Coordinate of input point P". Enter the following X coordinate of P in HyperTerminal or copy each line.
 Right-click HyperTerminal and select **Paste to Host** to paste the coordinate each line once as shown in Figure 8. Do not enter after copying each line.

e4ecbe709001fc39
```

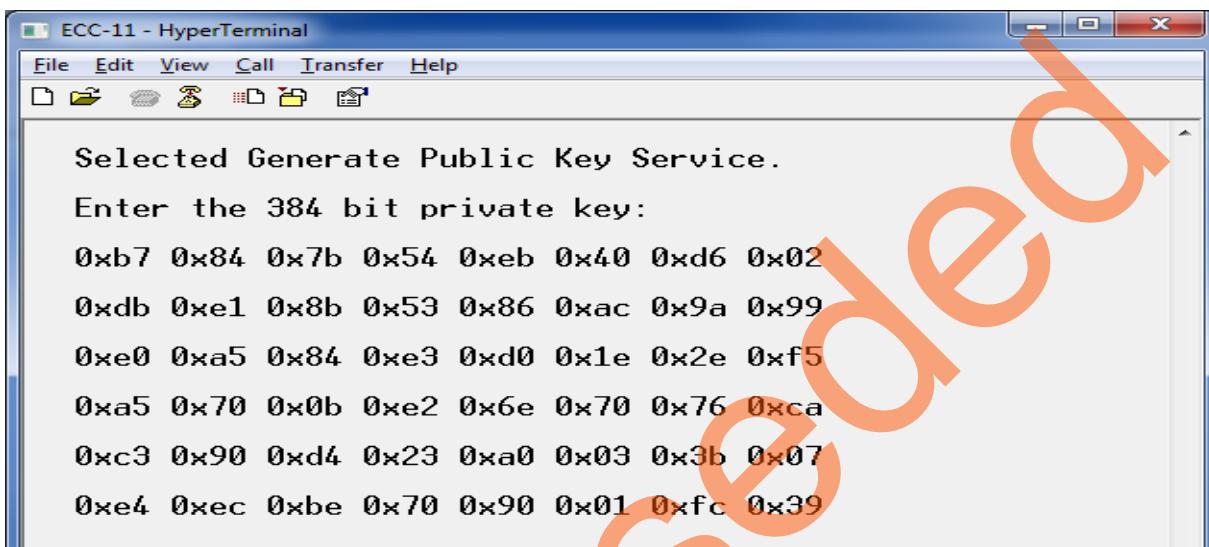

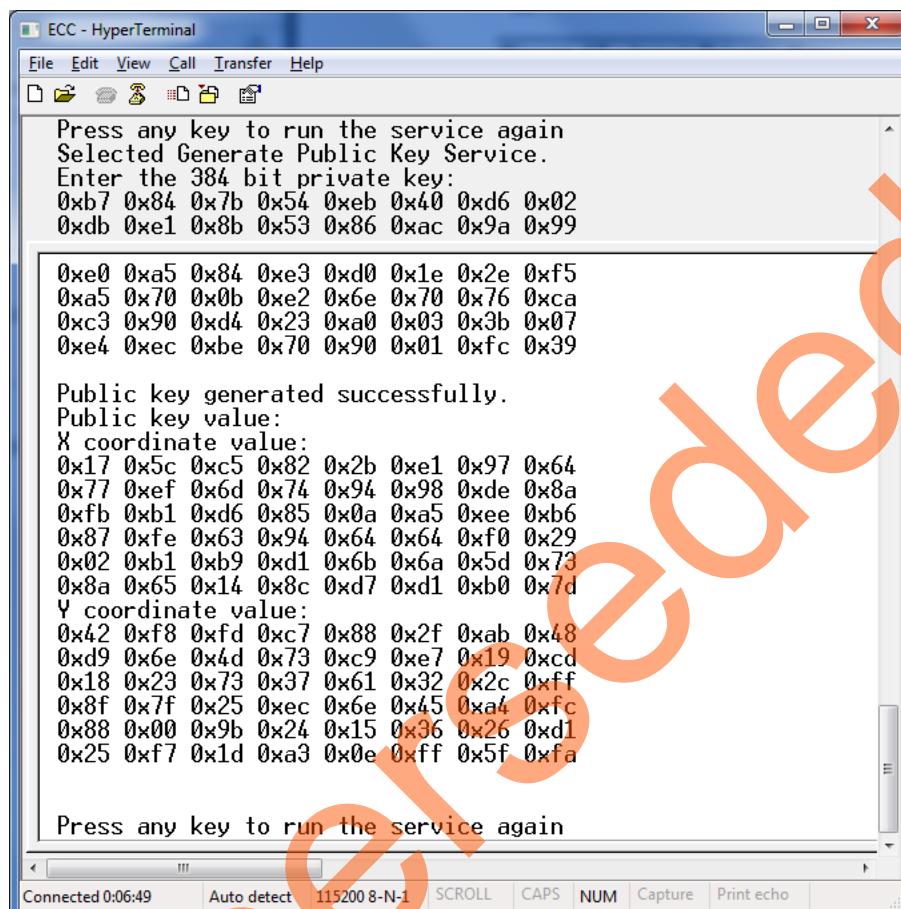

Figure 18 • Input Private Key

Superseded

This service uses the internal 384 bit base point and performs the point multiplication with a private key to generate the public key. Generated public key X, Y coordinates are displayed on the HyperTerminal window as shown in Figure 19.

```
Press any key to run the service again
Selected Generate Public Key Service.
Enter the 384 bit private key:
0xb7 0x84 0x7b 0x54 0xeb 0x40 0xd6 0x02
0xdb 0xe1 0x8b 0x53 0x86 0xac 0x9a 0x99

0xe0 0xa5 0x84 0xe3 0xd0 0x1e 0x2e 0xf5
0xa5 0x70 0x0b 0xe2 0x6e 0x70 0x76 0xca

Conclusion

This application note explains how to access the ECC services in the SmartFusion2 SoC FPGAs. It describes how to perform the ECC point addition, scalar point multiplication, and public key generation.

Appendix A: Design and Programming Files

Download the design files from the Microsemi website:

http://soc.microsemi.com/download/rsc/?f=m2s_ac435_liberov11p6_df

The design files consist a Libero Verilog project and programming files (*.stp) for the SmartFusion2 Security Evaluation Kit.

Refer to the `readme.txt` file included in the design files for the directory structure and description.

Download the programming files (*.stp) in release mode from the Microsemi website:

http://soc.microsemi.com/download/rsc/?f=m2s_ac435_liberov11p6_pf

The programming zip file consists the STAPL programming file (*.stp) for the SmartFusion2 Security Evaluation Kit.

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Ethernet Solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,600 employees globally. Learn more at www.microsemi.com.

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same.
