## Introduction

SmartFusion<sup>®</sup>2 system-on-chip (SoC) field programmable gate array (FPGA) devices integrate a fourth generation flash-based FPGA fabric and an ARM<sup>®</sup> Cortex<sup>®</sup>-M3 processor, along with high performance communication interfaces on a single chip. The SmartFusion2 high speed serial interface (SERDESIF) provides a fully hardened PCIe endpoint (EP) implementation and is compliant with PCIe Base Specification Revision 2.0 and 1.1. For more information, refer to the

UG0447: IGLOO2 and SmartFusion2 High Speed Serial Interfaces User Guide.

The demo explains the SmartFusion2 embedded PCI Express feature and how this can be used as a low bandwidth control plane interface using the SmartFusion2 Security Evaluation Kit. The demo provides a simple design to access the SmartFusion2 PCIe EP from a Host PC. A GUI is provided for read and write access to the SmartFusion2 PCIe configuration space and memory space of BAR0 and BAR1. The demo also provides Host PC device drivers for the SmartFusion2 PCIe EP. This demo can run on both windows and Red Hat Linux operating system.

Figure 1 shows the top-level block diagram for the PCIe control plane demo. The demo design uses a SmartFusion2 PCIe interface with a maximum link width of x4 to interface with a Host PC PCIe Gen2 slot. The SmartFusion2 microcontroller subsystem (MSS) GPIOs control the LEDs and switches on the SmartFusion2 Security Evaluation Kit through the PCIe interface. The Host PC can also read memory and writes to the SmartFusion2 eSRAM through the GUI. The Host PC can also be interrupted by using the push button on the SmartFusion2 Security Evaluation Kit.

#### Figure 1 • PCIe Control Plane Demo Top-Level Block Diagram

The demo design performs the following tasks:

- Displays the PCIe link enable or disable, negotiated link width, and the link speed.
- Controls the status of LEDs on the SmartFusion2 Security Evaluation Kit according to the command from the GUI.
- · Displays the position of DIP Switches on SmartFusion2 Security Evaluation Kit.
- Enables read and write to eSRAM.
- Interrupts the Host PC, when the push button is pressed. The GUI displays the count value of the number of interrupts sent from the SmartFusion2 Security Evaluation Kit.
- Displays the SmartFusion2 PCIe Configuration Space.

## **Demo Requirements**

### Hardware and Software Requirements

Table 1 shows the hardware and software required to run the demo.

#### Table 1 • Hardware and Software Requirements

Hardware	Version
SmartFusion2 Security Evaluation Kit	Rev C or later
12 V adapter (provided along with the kit)	-
FlashPro4 programmer (provided along with the kit)	-
Host PC with an available PCIe 2.0 Gen1 or Gen2 compliant slot	Operating system: Windows XP SP2: 64-bit Windows 7: 64-bit or Red Hat Linux Kernel Version: 2.6.18-308
Software	
Libero <sup>®</sup> System-on-Chip (SoC)	v11.6
SoftConsole	v3.4SP1
Host PC Drivers (provided along with the design files)	
GUI executable (provided along with the design files)	

## **Design Files**

The design files for this demo can be downloaded from the Microsemi website: http://soc.microsemi.com/download/rsc/?f=m2s\_dg0456\_liberov11p6\_df

Design files include:

- Libero project
- Linux\_64bit
- ProgrammingFile
- Windows\_64bit
- Source files
- Readme file

Refer to the Readme.txt file provided in the design files for the complete directory structure.

## **Demo Design Description**

This demo design implements the SmartFusion2 embedded PCI Express interface as a low bandwidth control plane interface. This design provides Host PC drivers and a Host PC interface over PCIe to control the SmartFusion2 device. Figure 2 shows a detailed block diagram of the design implementation. The PCIe EP device receives commands from the Host PC through the GUI and does corresponding memory writes to the SmartFusion2 MSS address space. The MSS address space provides a GPIO block and eSRAM memory block, which is accessed through a Fabric Interface Controller (FIC\_0).

The SERDES\_IF2\_0 is configured for a PCIe 2.0, x1 link width with GEN2 speed. The PCIe interface to the fabric uses an AMBA High-speed Bus (AHB). The AHB master interface of SERDESIF is enabled and connected to the AHB slave interface of FIC\_0 to access the MSS peripherals. The SmartFusion2 PCIe BAR0 and BAR1 are configured in 32-bit memory mapped memory mode.

The AXI master windows of the SERDESIF PCIe provide address translation for accessing one address space from another address space as the PCIe address is different from SmartFusion2 AHB bus matrix address space. The AXI master window 0 is enabled and configured to translate the BAR0 memory address space to the MSS GPIO address space to control the MSS GPIOs. The AXI master window 1 is enabled and configured to translate the BAR1 memory address space to the eSRAM address space to perform read and writes from PCIe.

MSS GPIO block is enabled and configured as below:

- GPIO\_0 to GPIO\_7 as outputs and connected to LEDs
- GPIO\_8 to GPIO\_11 as inputs and connected to DIP switches

The PCIe interrupt line is connected to the SW4 push button on the SmartFusion2 Security Evaluation Kit. The FPGA clocks are configured to run the FPGA fabric and MSS at 90 MHz.

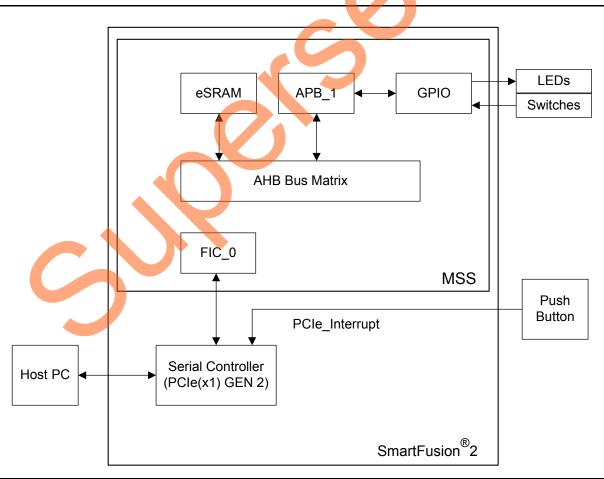

Figure 2 • PCIe Control Plane Demo Block Diagram

## **Building the Demo**

This demo design provides a complete design flow starting from a new project to a working design on the SmartFusion2 Security Evaluation Kit. This process includes usage of the tools in the Libero SoC design suite to program the SmartFusion2 device.

Building the demo involves the following steps:

- Step 1: Creating a Libero SoC Project
- Step 2: Creating an eNVM Client
- Step 3: Developing the Simulation Stimulus
- Step 4: Simulating the Design
- Step 5: Generating the Program File

## Step 1: Creating a Libero SoC Project

The following steps describe how to create a Libero SoC project:

 Click Start > Programs > Microsemi Libero SoC v11.6 > Libero SoC v11.6, or click desktop shortcut. The Libero SoC v11.6 Project Manager is displayed, as shown in Figure 3.

17. Configure MSS\_GPIO by clicking **MSS\_GPIO Configure**, as shown in Figure 15.

#### *Figure 15* • System Builder – Peripherals Page

18. Double-click **MSS\_GPIO** configuration button, as shown in Figure 15 and configure:

- GPIO\_0 to GPIO\_7 as outputs and their connectivity to FABRIC\_A to connect with LEDs
- GPIO\_8 to GPIO\_11 as inputs and their connectivity to FABRIC\_A, to connect with DIP switches

This design requires configuring GPIO\_0 to GPIO\_7 to drive LED\_1 to LED\_8 on the SmartFusion2 Security Evaluation Kit, and GPIO\_8 to GPIO\_11 to connect DIP1 to DIP4. These signals are routed through the fabric to the I/O pins.

- 24. Click Next. The System Builder Interrupts page is displayed. Do not change the default selections.
- 25. Click Next. The System Builder Memory Map page is displayed. Do not change the default selections.
  - 26. Click Finish. The System Builder generates the system based on the selected options.

The System Builder block is created and added to Libero SoC project automatically, as shown in Figure 18.

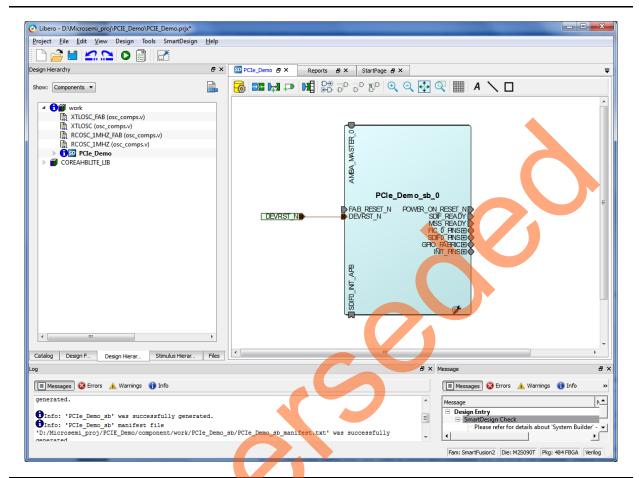

Figure 18 • SmartFusion2 System Builder Generated System

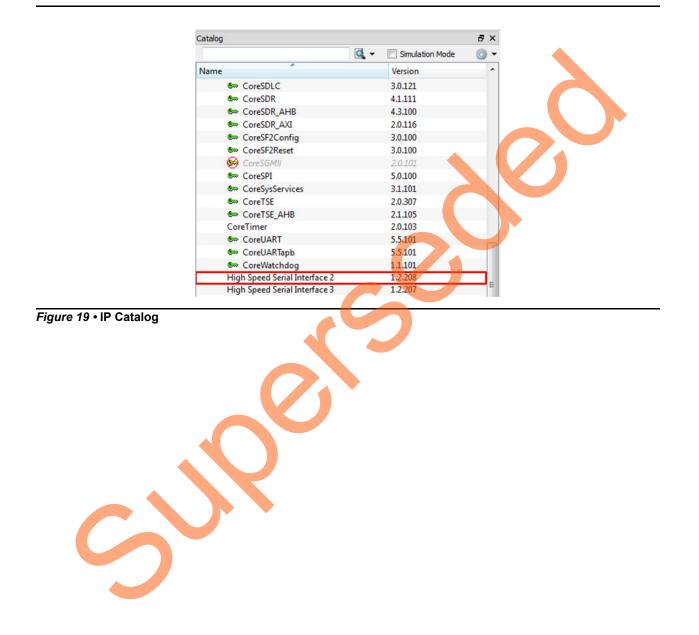

The two soft cores (CoreResetP and CoreConfigP) are automatically instantiated and connected by the System Builder. The block connections can be seen by opening the System Builder component in the SmartDesign canvas.

Note: CoreResetP and CoreConfigP are responsible for the reset and configuration of ASIC peripherals. In this particular demo they are used to reset and configure the SERDESIF module. These modules are included in the System Builder generated component when an ASIC peripheral is selected.

### Instantiating SERDESIF Component in PCIe\_Demo SmartDesign

The Libero SoC Catalog provides IP cores that can be easily dragged-and-dropped into the SmartDesign Canvas workspace. Many of these IPs are free to use while several require a license agreement. The SERDESIF module that supports the PCIe embedded interface is included in the catalog. To instantiate the SERDESIF component in the **PCIe\_Demo** SmartDesign, expand the **Peripherals** category in the Libero SoC Catalog.

- 1. Drag the **High Speed Serial Interface2** onto the **PCIe\_Demo SmartDesign** canvas. If the component appears shadowed in the Vault, right-click the name and select **Download**.
- 2. Double-click the **SERDES\_IF2\_0** component in the SmartDesign canvas to open the **SERDES** configurator. Configure the SERDES with the following settings, as shown in Figure 20:

 $\mathbf{A}$ 

- Select SERDESIF\_0

Figure 21 • PCIe Configuration for Protocol 1

- 4. Click the **Master Interface** tab to configure the PCIe master windows. The PCIe AXI master windows are used to translate the PCIe address domain to the local device address domain. In this demo the PCIe AXI master windows are used to translate the address of BAR0 and BAR1 to CoreGPIO address and COREAHBLSRAM address. Make settings as shown in Figure 22.
  - Select Window 0 and configure following settings:
    - Size: Select as 1MB from the drop-down list
    - PCIe BAR: Select as Bar0 from the drop-down list
    - Local Address: Enter values as 0x40000 to translate the BAR0 address space to CoreGPIO address (0x4000\_0000)
  - Select Window 1 and configure following settings
    - Size: Select as 64KB from the drop-down list
    - PCIe BAR: Select as Bar1 from the drop-down list
    - Local Address: Enter values as 0x20000 to translate the BAR1 address space to COREAHBLSRAM address (0x2000 0000)

For more information on PCIe address translation, refer to the Address Translation on the AXI Master Interface section of the UG0447: IGLOO2 and SmartFusion2 High Speed Serial Interfaces User Guide.

- 5. Click **OK** to close PCIe Configuration window.
- 6. Click **OK** to save and close the High Speed Serial Interface Configurator.

### Instantiating Debounce Logic in PCIe\_Demo SmartDesign

- 1. The demo provides a push button on the SmartFusion2 Security Evaluation Kit to send an interrupt to the Host PC. This push button generates switch bounce that causes multiple interrupts to PCIe. Debounce logic is required to avoid the switch bounce.
- 2. To add the debounce logic to the PCIe demo design, click File > Import > HDL Source files.
- Browse to the Debounce.v or Debounce.vhd file location in the design files folder: <u>M2S90\_PCIE\_Control\_DEMO\_DF/Source Files</u>. Figure 23 shows the DEBOUNCE component in the Design Hierarchy window.

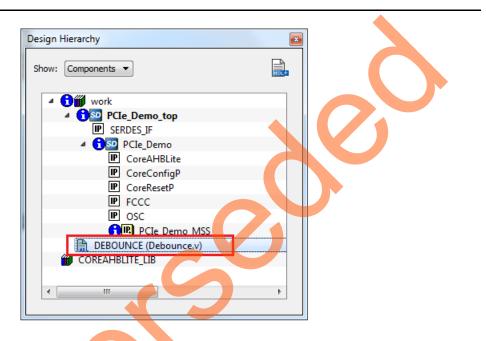

Figure 23 • DEBOUNCE Component in Design Hierarchy Window

3

 Click the PCle\_Demo tab and drag the DEBOUNCE component from the Design Hierarchy into the PCle\_Demo SmartDesign canvas, as shown in Figure 24. A SmartDesign symbol for the Verilog HDL file is automatically generated.

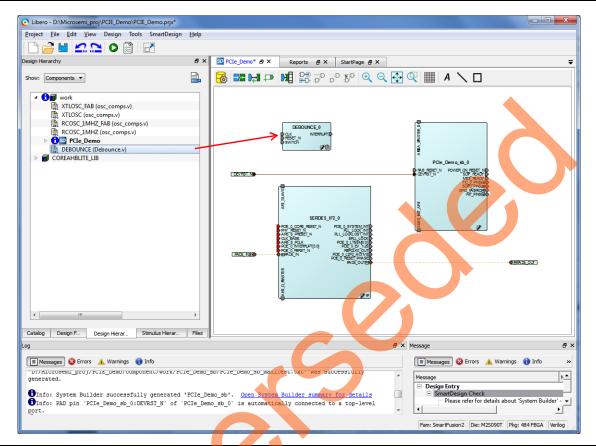

Figure 24 • DEBOUNCE Component in Design Hierarchy

The PCIe\_Demo is displayed, as shown in Figure 26 on page 27. Connect the pins of all the blocks as described in the "Connecting Components in PCIe\_Demo SmartDesign" section.

## Connecting Components in PCIe\_Demo SmartDesign

There are three methods for connecting components in PCIe\_Demo SmartDesign.

The first method is by using the **Connection Mode** option. To use this method, change the SmartDesign to connection mode by clicking **Connection Mode** on the SmartDesign window, as shown in Figure 26 on page 27. The cursor changes from the normal arrow shape to the connection mode icon shape. To make a connection in this mode, click on the first pin and drag-drop to the second pin that you want to connect.

The second method is by selecting the pins to be connected together and selecting **Connect** from the context menu. To select multiple pins to be connected together, press down the **CTRL** key while selecting the pins. Right-click the input source signal and select **Connect** to connect all the signals together. Similarly, select the input source signal, right-click it, and select **Disconnect** to disconnect the signals already connected.

The third method is by using the **Quick Connect** option. To use this method, change the SmartDesign to quick connect mode by clicking **Quick Connect** mode on the SmartDesign window, as shown in Figure 25. **Quick Connect** window opens. Find the Instance Pin that needs to be connected and click to select it. In Pins to Connect, find the pin that needs to be connected, right-click and choose **Connect**, as shown in Figure 25.

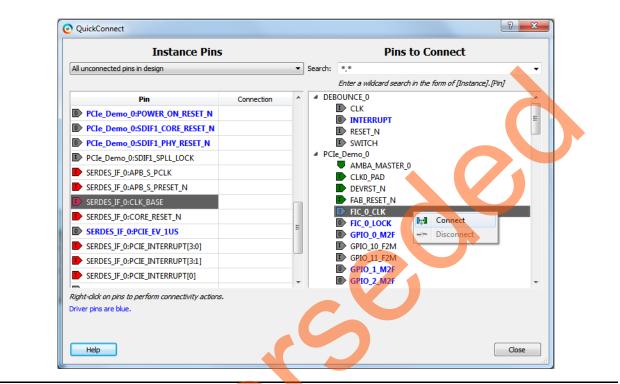

Figure 25 • Quick Connect Window

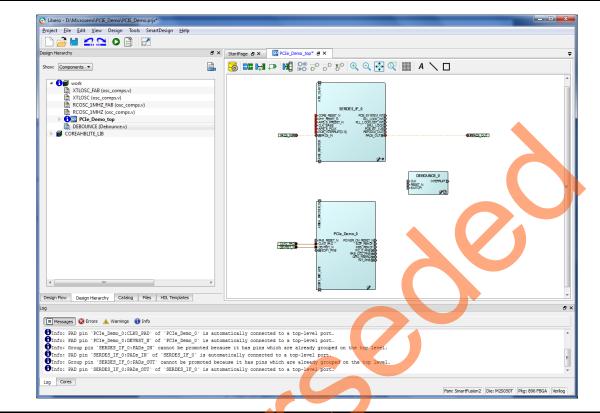

Figure 26 • PCIe Demo Top in SmartDesign

Use one of the three options and make the following connections:

- 1. Expand FIC\_0\_PINS of PCIe\_Demo\_sb\_0 and make connections, as shown in Table 2.
- 2. Right-click FIC\_0\_LOCK and select Mark Unused

Table	2•	FIC 0	PINS

From PCIe_Demo_sb_0		То
FIC 0 CLK		CLK_BASE of SERDES_IF2_0
		CLK of DEBOUNCE_0

3. Expand SDIF0\_PINS of PCIe\_Demo\_sb\_0 and make connections, as shown in Table 3.

Table 3 • SDIF0\_PINS

From PCle_Demo_sb_0	To SERDES_IF2_0
SDIF0_PHY_RESET_N	PHY_RESET_N
SDIF0_0_CORE_RESET_N	PCIE_0_CORE_RESET_N
SDIF0_SPLL_LOCK	SPLL_LOCK

- 4. Right-click SDIF0\_1\_CORE\_RESET\_N and select Mark Unused.
- 5. Right-click PCIE\_0\_PERST\_N and select Promote to Top Level.

6. Expand INIT\_PINS of PCIe\_Demo\_sb\_0 and make connections, as shown in Table 4.

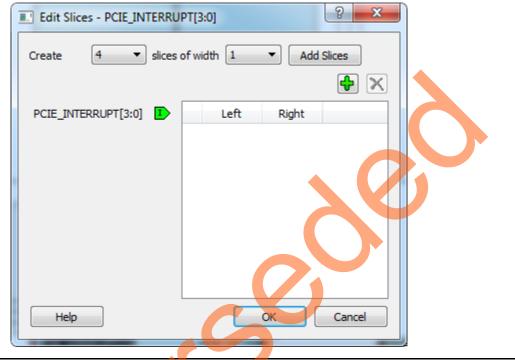

#### Table 4 • INIT\_PINS

From PCle_Demo_sb_0	To SERDES_IF2_0
INIT_APB_S_PCLK	APB_S_PCLK
INIT_APB_S_PRESET_N	APB_S_PRESET_N

- 7. Right-click **INIT\_DONE** and select **Mark Unused**.
- 8. Connect MSS\_READY of PCIe\_Demo\_sb\_0 and RESET\_N of DEBOUNCE\_0.
- 9. Right-click FAB\_RESET\_N of PCIe\_Demo\_sb\_0 and select Tie High.
- 10. Right-click GPIO\_FABRIC of PCIe\_Demo\_sb\_0 and select Promote to Top Level.
- 11. Right-click POWER\_ON\_RESET\_N of PCIe\_Demo\_sb\_0 and select Mark Unused.
- 12. Right-click **SDIF\_READY** of **PCIe\_Demo\_sb\_0** and select **Mark Unused**.
- 13. Connect AMBA\_MASTER\_0 of PCIe\_Demo\_sb\_0 and AHB\_MASTER of SERDES\_IF2\_0.
- 14. Expand FAB\_CCC\_PINS, right-click FAB\_CCC\_GL3 and select Mark Unused.
- 15. Connect SDIF1\_INIT\_APB of PCIe\_Demo\_sb\_0 and APB\_SLAVE of SERDES\_IF2\_0.
- 16. Right-click the SWITCH of DEBOUNCE\_0 and select Promote to Top Level.
- 17. Select the following ports of SERDES\_IF2\_0 by pressing down the CTRL key, right-click, and select Mark Unused.
  - PCIE\_SYSTEM\_INT
  - PLL\_LOCK\_INT
  - PLL\_LOCKLOST\_INT
  - PCIE\_EV\_1US
  - REFCLK0\_OUT
  - PCIE\_0\_LTSSM[5:0]
  - PCIE\_0\_L2P2\_ACTIVE
  - PCIE\_0\_RESET\_PHASE

The PCIe supports four interrupts. This design uses only one interrupt out of four by connecting the unused interrupts to logic '0'. To connect unused interrupt pins to logic '0' split the interrupt pins to two groups. To do that right-click the **PCIE\_INTERRUPT[3:0]** of **SERDES\_IF2\_0** and select **Edit Slices**. The Edit Slices window is displayed, as shown in Figure 27.

18. Click the + sign and create a slice with the Left index 0 and the Right index 0. Click + again to create a second slice with Left index 3 and Right index 1, as shown in Figure 28.

	Create 4 slices		Add Slices	×
	PCIE_INTERRUPT[3:0]	Left 1 0	Right 0	
5		2 3	1	
	Help		OK Cancel	

19. Expand PCIE\_INTERRUPT[3:0], right-click the PCIE\_INTERRUPT[3:1], and select Tie low.

- 20. Connect **INTERRUPT** of **DEBOUNCE\_0** to the **PCIE\_INTERRUPT[0]** of **SERDES\_IF2\_0**.
- 21. Click **Auto arrange instances** to arrange the instances and click **File > Save**. The PCle\_Demo is displayed, as shown in Figure 29.

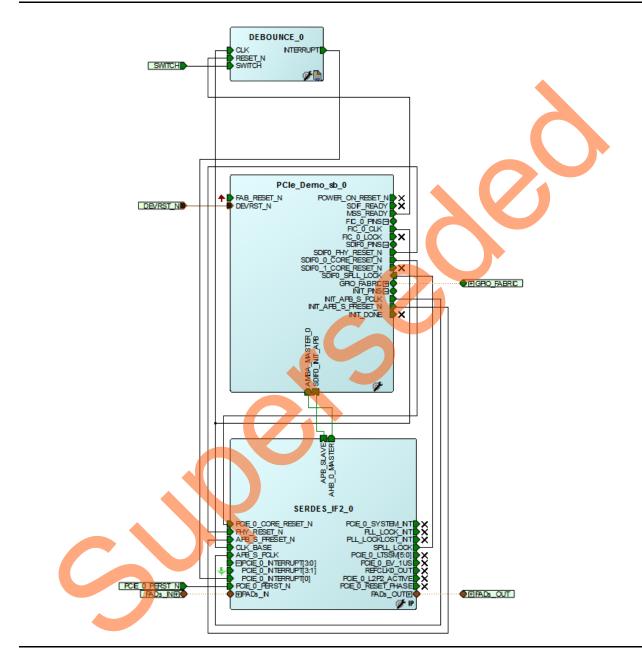

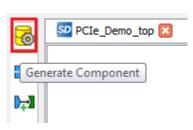

Figure 29 • PCIe Demo Top Design

22. Click the PCIe\_Demo tab and click Generate Component icon, as shown in Figure 30.

#### Figure 30 • Generate Component

The message "PCIe\_Demo" was successfully generated is displayed in the Libero SoC log window, if the design is generated without any error. The log window is displayed on a successful component generation, as shown in Figure 31

#### Figure 31 • Log Window

### **Configuring and Generating Firmware**

The following steps describe how to configure and generate firmware.

1. Double click **Configure Firmware Cores** under **Handoff Design for Firmware Development** in Design Flow and clear all drivers except CMSIS, as shown in Figure 32.

9							
	Generate		Instance Name	Core Type	Version	Compatible Hardware Instance	
	V	Ø 🖣	SmartFusion2_CMSIS_0	SmartFusion2_CMSIS	2.2.101 🗸	PCIe_Demo_MSS

Info: SoftConsole work	

## Step 2: Creating an eNVM Client

The HDL and logical design portion of the demo is now complete. The following sections describe the creation of the Cortex-M3 firmware used to initialize the MSS and SERDESIF.

The eNVM client has to be uploaded with the firmware application to initialize the SERDESIF through **CoreConfigP**. The Cortex-M3 processor executes the code in the eNVM after the SmartFusion2 device has been reset. In this design the eNVM client is created with the firmware application code to initialize the SERDESIF.

The following steps describe how to create an eNVM Client:

1. To build the firmware eNVM client, invoke the standalone SoftConsole IDE. The **SoftConsoleIDE Project Workspace** window is displayed, as shown in Figure 35.

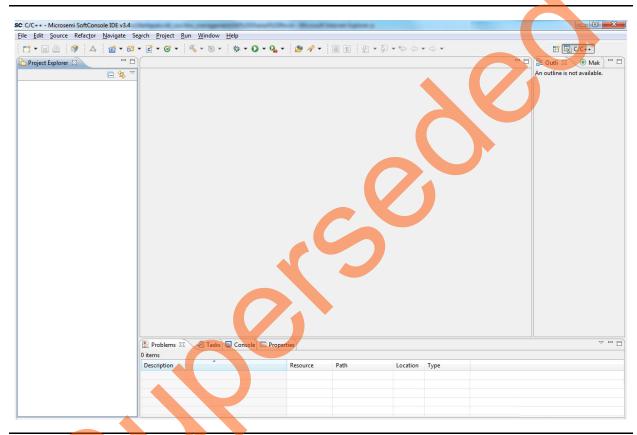

Figure 35 • SoftConsole IDE Project Workspace

2. Import the existing project into workspace, as shown in Figure 36.

### Figure 49 • Modify Core - ENVM

25. Save PCle\_Demo and regenerate the PCle\_Demo component by clicking Generate Component in SmartDesign.

# Step 3: Developing the Simulation Stimulus

During the design process, SERDESIF is configured for the BFM simulation model. The BFM simulation model replaces the entire PCIe interface with a simple BFM that can send write transactions and read transactions over the AHB-Lite interface. These transactions are driven by a file and allow easy simulation of the FPGA design connected to a PCIe interface. This simulation methodology has the benefit of focusing on the FPGA design since the SmartFusion2 PCIe interface is a fully hardened and verified interface.

This section describes how to modify the BFM script (user.bfm) file that is generated by SmartDesign. The BFM script file simulates PCIe writing or reading to or from the MSS through the FIC\_0.

 Open the serdesif\_0\_PCIE\_0\_user.bfm file. To open the serdesif\_0\_PCIE\_0\_user.bfm, go to the Files tab > Simulation folder, and double-click the serdesif\_0\_PCIE\_0\_user.bfm. The serdesif\_0\_PCIE\_0\_user.bfm file is displayed, as shown in Figure 50.

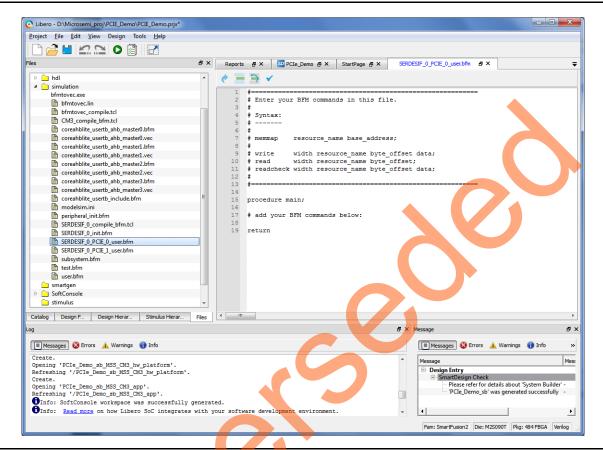

Figure 50 • SmartDesign Generated SERDESIF\_1\_user.bfm File

2. Modify the SERDESIF O POIE O user. bfm to add the following bfm commands of writing and reading: memmap GPIO 0x40013000; memmap eSRAM 0x20000000; procedure main; # add your BFM commands below: wait 500us; wait 500us; write w GPIO 0x00 0x5; write w GPIO 0x04 0x5; write w GPIO 0x08 0x5; write w GPIO 0x0C 0x5; write w GPIO 0x10 0x5; write w GPIO 0x14 0x5; write w GPIO 0x18 0x5; write w GPIO 0x1C 0x5; write w GPIO 0x88 0x00; write w GPIO 0x88 0x01; write w GPIO 0x88 0x02;

```
write w GPIO 0x88 0x04;
write w GPIO 0x88 0x08;
write w GPIO 0x88 0x10;
write w GPIO 0x88 0x20;
write w GPIO 0x88 0x40;
write w GPIO 0x88 0x40;
write w GPIO 0x88 0x80;
write w eSRAM 0x00 0x12345678;
write w eSRAM 0x04 0x87654321;
write w eSRAM 0x08 0x9ABCDEF0;
write w eSRAM 0x00 0x12345678;
readcheck w eSRAM 0x00 0x12345678;
readcheck w eSRAM 0x04 0x87654321;
readcheck w eSRAM 0x08 0x9ABCDEF0;
readcheck w eSRAM 0x08 0x9ABCDEF0;
readcheck w eSRAM 0x08 0x9ABCDEF0;
readcheck w eSRAM 0x00 0x07EDCBA9;
```

- The modified BFM file appears similar to the file, as shown in Figure 51. BFM commands are added in the SERDESIF 0 PCIE 0 user.bfm. Perform the following:
  - Write to MSS GPIO
  - Write to eSRAM
  - Read-check from eSRAM

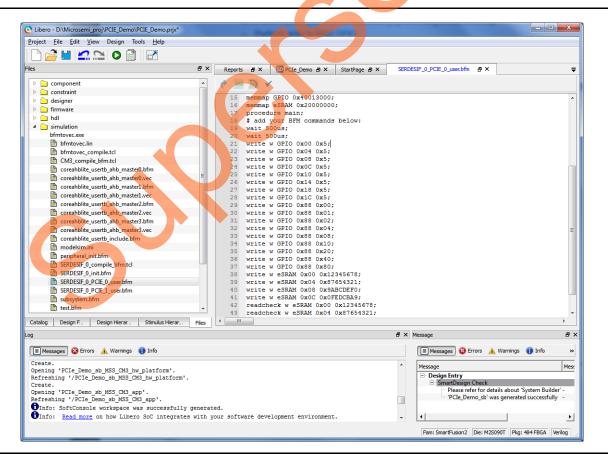

Figure 51 • Modified SERDES User BFM

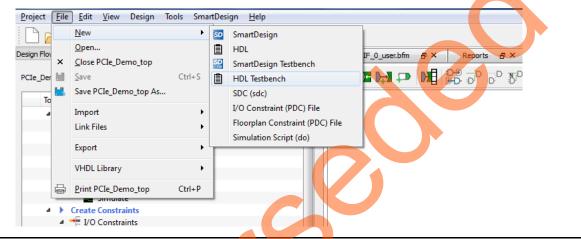

# Step 4: Simulating the Design

The design supports the BFM\_PCIe simulation level to communicate with the High Speed Serial Interface block through the master AXI bus interface. Although, no serial communication actually goes through the High Speed Serial Interface block, this scenario allows validating the fabric interface connections. The SERDESIF\_1\_user.bfm file under the <Libero project>/simulation folder contains the BFM commands to verify the read or write access to MSS GPIOs and eSRAM.

The following steps describe how to use the SmartDesign testbench and BFM script file to simulate the design.

- 1. To generate the HDL testbench file follow the below instructions,
  - a. From the File menu, choose New > HDL Testbench, as shown in Figure 52.

Create New HDL Testbench File dialog box is displayed, as shown in Figure 53.

Create New HDL Testbench File
HDL Type
Verilog O VHDL
Names
testbench
Dijitalize file with standard template
Instantiate Root Design
Set as Active Stimulus
Help OK Cancel

Figure 53 • Create New HDL Testbench File

- b. Select Verilog or VHDL under HDL Type.
- c. Enter testbench as a name of the new hdl testbench file and click OK.
- Add the wave do file to the PCIe demo design simulation folder by clicking File > Import > Others.

3. Browse to the wave.do file location in the design files folder:

*M2S90\_PCIE\_Control\_Demo\_DF/Source Files.* Figure 54 shows the wave.do file under simulation folder in the **Files** window.

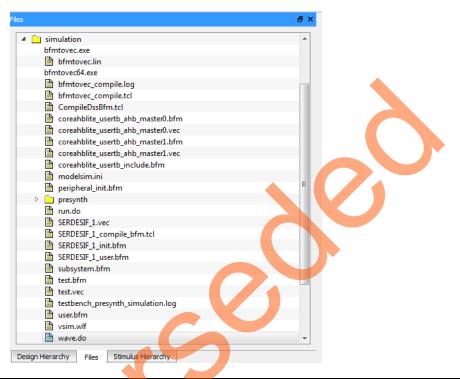

Figure 54 • Wave.do File under Simulation Folder

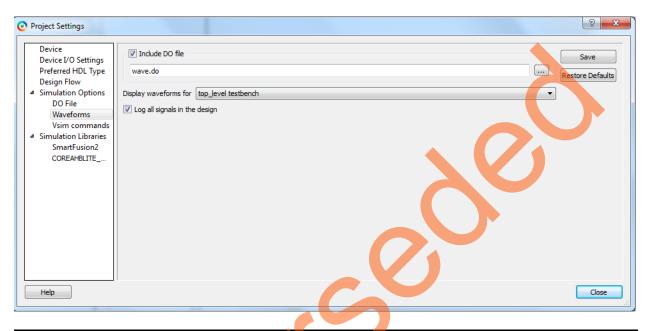

- 4. Open the Libero SoC project settings (Project > Project Settings).
- 5. Select **Do File** under **Simulation Options** in the Project Settings window. Change the **Simulation runtime** to **150us**, as shown in Figure 55.
- 6. Click Save.

Figure 55 • Project Setting – Do File Simulation Runtime Setting

- 7. Select Waveforms under Simulation Options, as shown in Figure 56:
  - Select Include Do file.
  - Select Log all signals in the design.
  - Click **Close** to close the Project settings dialog box.
  - Select **Save** when prompted to save the changes.

### Figure 56 • Project Setting – Waveform

To run the simulation, double-click Simulate under Verify Pre-Synthesized Design in the Design Flow window.

ModelSim runs the design for approximately 150us. The ModelSim transcript window displays the BFM commands and the BFM simulation completed with no errors, as shown in Figure 57.

### Figure 57 • SERDES BFM Simulation

Figure 58 shows the waveform window with MSS GPIO output signals.

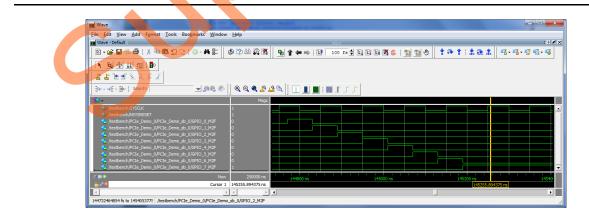

Figure 58 • Simulation Result with MSS GPIO Signals

# Step 5: Generating the Program File

The following steps describe how to generate the program file.

1. Double-click **I/O Constraints** in the **Design Flow** window, as shown in Figure 59. The **I/O Editor** window is displayed after completing Synthesize and Compile.

### Figure 59 • I/O Constraints

The **I/O Editor** is displayed. Make the pin assignments, as shown in Table 5. After the pins have been assigned, the I/O Editor is displayed, as shown in Figure 60 on page 54.

### Table 5 • Port to Pin Mapping

2.

Port Name	Pin Number
GPIO_0_M2F	E1
GPIO_1_M2F	F4
GPIO_2_M2F	F3
GPIO_3_M2F	G7
GPIO_4_M2F	H7
GPIO_5_M2F	J6

### Table 5 • Port to Pin Mapping (continued)

Port Name	Pin Number
GPIO_6_M2F	H6
GPIO_7_M2F	H5
GPIO_8_M2F	L19
GPIO_9_M2F	L18
GPIO_10_M2F	K21
GPIO_11_M2F	К20
SWITCH	J18
PCIE0_PERST_N	P18

These pin assignments are for connecting below on the SmartFusion2 Security Evaluation Kit.

- CLK0\_PAD to 50 MHz Clock Oscillator
- GPIO\_0 to GPIO\_8 for LEDs
- GPIO\_8 to GPIO\_11 for DIP switches
- SWITCH for SW4
- PCIE\_0\_PERST\_N to PERST of PCIe Edge connector

# **Running the Demo**

# **Demo Setup**

Following are the steps to setup the demo for SmartFusion2 Security Evaluation Kit board:

- 1. Connect the FlashPro4 programmer to the J5 connector of the SmartFusion2 Security Evaluation Kit board.
- 2. Connect the jumpers on the SmartFusion2 Security Evaluation Kit board, as shown in Table 4.

**CAUTION:** The power supply switch SW7 on the board should be in OFF position, while making the jumper connections.

Jumper	Pin (from)	Pin (to)	Comments
J22, J23, J24, J8, J3	1	2	These are the default jumper settings of the SmartFusion2 Security Evaluation Kit board. Ensure, these jumpers are set accordingly.

- 3. Connect the power supply to the **J6** connector.
- 4. Switch the power supply switch SW7 to ON position.
- 5. To program the SmarFusion2 device double-click **Run PROGRAM Action** in the **Design Flow** tab, as shown in Figure 62.

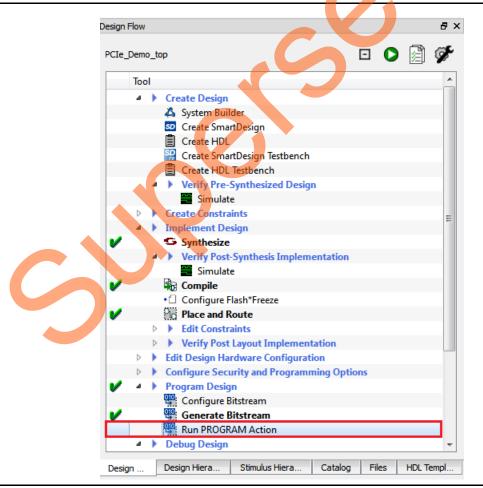

Figure 62 • Run PROGRAM Action

- 6. After Successful programming, power OFF the SmartFusion2 Security Evaluation Kit and shut down the Host PC.
- 7. Following are the steps to connect the **CON1-PCIe Edge Connector** either to Host PC or laptop:

a. Connect the CON1-PCIe Edge Connector to Host PC PCIe Gen 2 slot or Gen 1 slot, as applicable. If the Host PC does not support the Gen 2 compliant slot, the design switches to the Gen 1 slot.

b. Connect the CON1-PCIe Edge Connector to the laptop PCIe slot using the express card adapter. If you are using a laptop, the express card adapters typically support only Gen 1 and the design works on Gen 1 slot.

**CAUTION:** Host PC or laptop should be powered OFF while inserting the PCIe Edge Connector. If the system is not powered OFF, the PCIe device detection and selection of Gen 1 or Gen 2 does not occur properly. Microsemi recommends that the Host PC or laptop should be powered OFF during the PCIe card insertion.

The board setup is as shown in Figure 63.

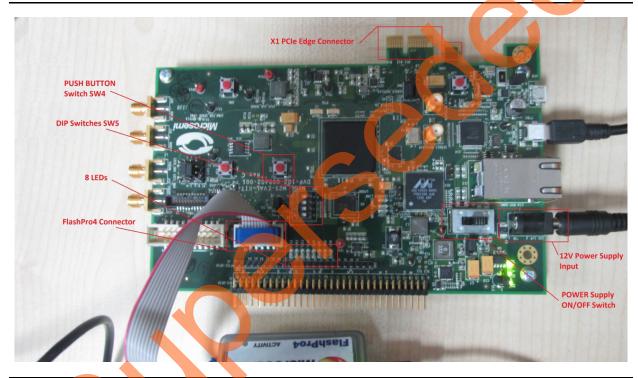

Figure 63 • SmartFusion2 Security Evaluation Kit Setup

8. Switch ON the power supply switch, SW7.

# **Running the Demo Design**

This demo can run on both windows and Red Hat Linux operating system.

To run the demo on Windows operating system GUI, Jungo drivers are provided. Refer to "Running the Demo Design on Windows" on page 57.

To run the demo on Linux operating system native Red Hat Linux drivers and command line scripts are provided. Refer to "Running the Demo Design on Linux" on page 70.

# **Running the Demo Design on Windows**

The following steps describe how to run the Demo Design on Windows:

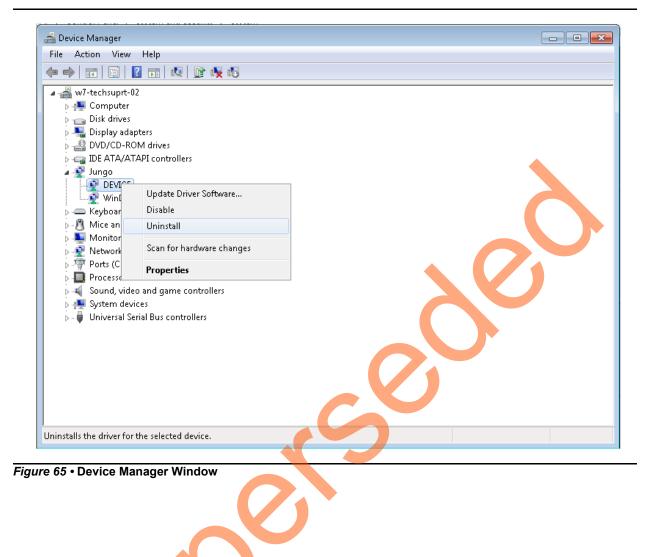

1. Power on the Host PC and check the Host PC Device Manager for PCIe Device. It is similar to Figure 64. If the device is not detected, power cycle the SmartFusion2 Security Evaluation Kit and click Scan for hardware changes in Device Manager window.

### Figure 64 • Device Manager - PCle Device Detection

- 2. If the Host PC has any other installed drivers (previous versions of Jungo drivers) for the SmartFusion2 PCIe device, uninstall them. To uninstall previous versions of Jungo drivers follow steps 3 and 4.
- 3. To uninstall previous Jungo drivers go to **Device Manager**, right-click on **DEVICE**, and click **Uninstall**, as shown in Figure 65 on page 58.

4. **Confirm Device Uninstall** window is displayed, as shown in Figure 66. Confirm Device Uninstall.Select **Delete the driver software for this device**. After uninstalling previous Jungo drivers, ensure that the PCI Device is detected in the **Device Manager** window, as shown in Figure 66.

Confirm Device Uninstall
DEVICE
Warning: You are about to uninstall this device from your system.
Delete the driver software for this device.
OK Cancel

### *Figure* 66 • Confirm Device Uninstall Dialogue Box

Note: If the device is still not detected, check if the BIOS version in Host PC is latest, and if PCI is enabled in the Host PC BIOS.

### Drivers Installation

The PCIe Demo uses a driver framework provided by Jungo WinDriverPro. To install the PCIe drivers on Host PC for SmartFusion2 Security Evaluation Kit, use the following steps:

- 1. Extract the **PCIe\_Demo.rar** to C:\ drive. The PCIe\_Demo.rar is located in the provided design files:
  - M2S90\_PCIE\_Control\_DEMO\_DF\Windows\_64bit\Drivers\PCIe\_Demo.rar
- 2. Run the batch file C:\PCIe\_Demo\DriverInstall\Jungo\_KP\_install.bat Note:Installing these drivers require Host PC Administration rights.

3. In the Windows Security dialog box, click Install, as shown in Figure 67.

### Figure 67 • Jungo Driver Installation

- Note: If the installation is not in progress, right-click on the command prompt and select Run as administrator. Run the batch file C:\PCIe\_Demo\DriverInstall\Jungo\_KP\_install.bat from command prompt.
  - 4. Click Install this driver software anyway, as shown in Figure 68.

### Figure 68 • Windows Security

# PCIe Demo GUI

SmartFusion2 PCIe Demo GUI is a simple graphic user interface that runs on the Host PC to communicate with the SmartFusion2 PCIe EP device. The GUI provides the PCIe link status, driver information, and demo controls. The GUI invokes the PCIe driver installed on the Host PC and provides commands to the driver according to the user selection.

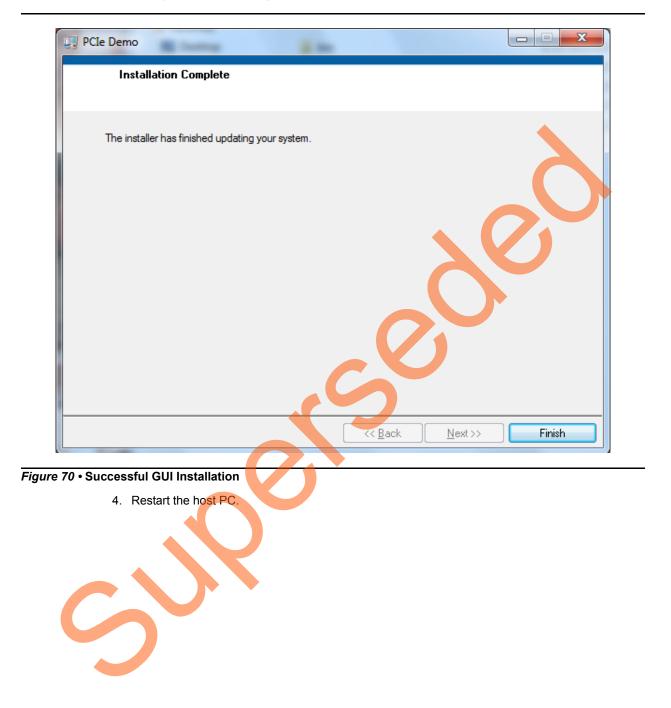

The following steps are used to install the GUI:

- 1. Download the PCIe\_Demo\_GUI Installer from the following link. http://soc.microsemi.com/download/rsc/?f=PCIe\_Demo\_GUI\_Installer
- 2. Double-click **setup.exe** in the provided GUI installation (PCIe\_Demo\_GUI\_Installer\setup.exe). Apply default options, as shown in Figure 69.

Destination Directory	
Select the primary installation directory.	
All software will be installed in the following	g locations. To install software into a
different locations, click the Browse button	n and select another directory.
Directory for PCIe Demo	
C:\Program Files\PCIe Demo\	Browse
Directory for National Instruments produ	cta
C:\Program Files\National Instruments\	
	Diowse
	<a back="" next="">&gt; Cancel</a>
	<< <u>Back</u> Next >> <u>C</u> ancel

3. Click **Next** to complete the installation. After successful installation, the following window is displayed, as shown in Figure 70.

## Running the Design

The following steps describe how to run the design.

 Check the Host PC Device Manager for the drivers. If the device is not detected, power cycle the SmartFusion2 Security Evaluation Kit and click Scan for hardware changes in Device Manager. Ensure that the board is switched on.

Figure 71 • Device Manager - PCIe Device Detection

Note: If a warning symbol is displayed on the **DEVICE** or **WinDriver** icons in the **Device Manager**, uninstall them and start from step1 of "Drivers Installation" on page 59.

 Invoke the GUI from ALL Programs > PCIeDemo > PCIe Demo. The GUI is displayed, as shown in Figure 72.

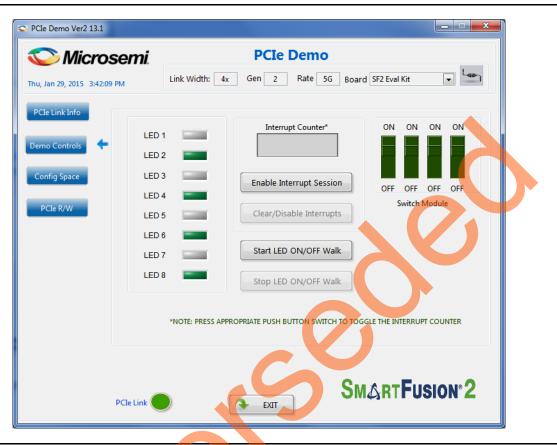

3. Click **Connect** button at the top-right corner of the GUI. The messages are displayed on the GUI, as shown in Figure 73.

4. Click **Demo Controls** in the GUI displays the LEDs options and DIP switch positions, as shown in Figure 74.

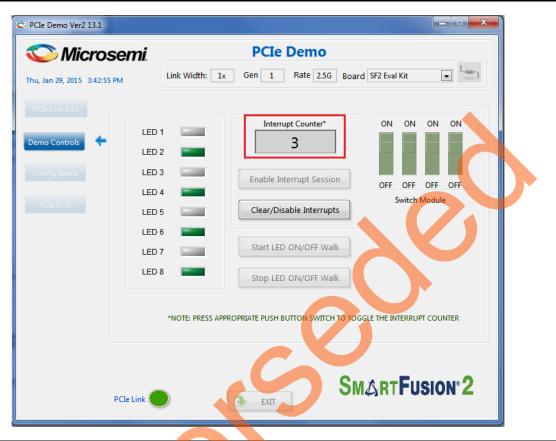

### Figure 74 • Demo Controls

- 5. Click LEDs in GUI to ON/OFF the LEDs on the SmartFusion2 Security Evaluation Kit.
- 6. Click Start LED ON/OFF Walk to blink the LEDs on the SmartFusion2 Security Evaluation Kit.
- 7. Click Stop LED ON/OFF Walk to stop the LEDs blinking.
- 8. Change the DIP switch positions on the SmartFusion2 Security Evaluation Kit (SW10) and observe the similar position of switches in GUI SWITCH MODULE.
- 9. Click Enable Interrupt Session to enable the PCIe interrupt.

10. Press the push button SW3 on the SmartFusion2 Security Evaluation Kit and observe the interrupt count on the **Interrupt Counter** field in GUI, as shown in Figure 75.

### Figure 75 • Interrupt Counter

11. Click **Clear/Disable Interrupts** to clear and disable the PCIe interrupts.

12. Click **Config Space** to read details about the PCIe configuration space. Figure 76 shows the PCIe configuration space.

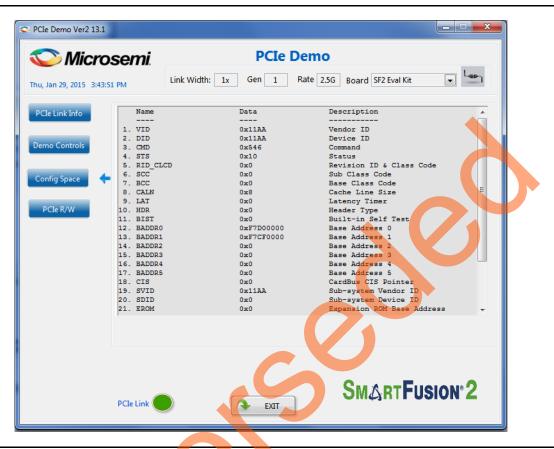

Figure 76 • Configuration Space

13. Click PCIe R/W to perform read and writes to eSRAM memory through BAR1 space. Figure 77 shows the PCIe R/W window.

14. Enter the address in the Address field between 0x0000 to 0xFFFC. The Data field accepts a 32-bit hexadecimal value.

PCIe Link		

Figure 77 • Perform Read and Write to eSRAM Using PCIe

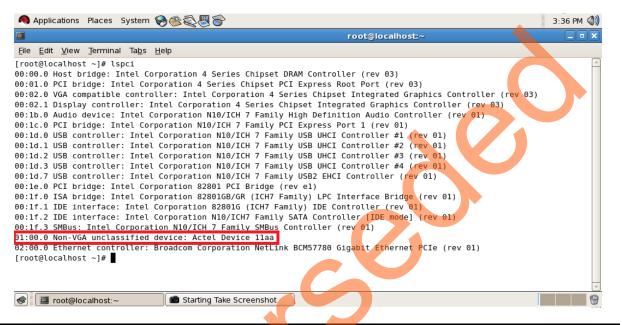

15. Click Exit to quit the demo.

# **Running the Demo Design on Linux**

The following steps describe how to run the Demo Design on Linux.

- 1. Switch ON the Red Hat Linux Host PC.
- 2. Red Hat Linux Kernel detects the SmartFusion2 PCIe end point as Actel Device.
- 3. On Linux Command Prompt Use lspci command to display the PCIe info.
  - # lspci

#### Figure 78 • PCle Device Detection

### **Drivers Installation**

Enter the following commands in the Linux command prompt to install the PCIe drivers:

- 1. Create the **sf2** directory under the **home**/ directory using the following command:
  - # mkdir /home/sf2
- 2. Copy the M2S90\_PCIe\_Control\_Plane\_DF design files folder under /home/sf2 directory, which contains the Linux PCIe device driver files and Linux PCIe application utility files.
- Copy the Linux PCIe Device Driver file (PCIe\_Driver.rar) from M2S90\_PCIe\_Control\_Plane\_DF/design files folder.

cp -rf/home/sf2/M2S90\_PCIe\_Control\_Plane\_DF/Linux\_64bit/Drivers/ PCIe\_Driver.rar/home/sf2# unzip\_PCIe\_Driver.rar

- 4. Execute 1s command to display the contents of /home/sf2 directory.
- 5. Change to inc/ directory by using the following command:

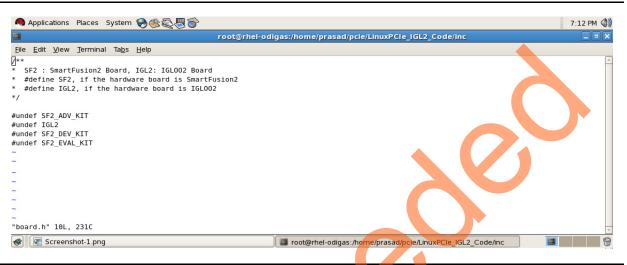

#cd /home/sf2/inc

# 15

6. Edit the board.h file for SmartFusion2 Security Evaluation Kit, as shown in Figure 79.

#vi board.h
#undef SF2\_ADV\_KIT
#undef IGL2
#undef SF2\_DEV\_KIT
#define SF2\_EVAL KIT

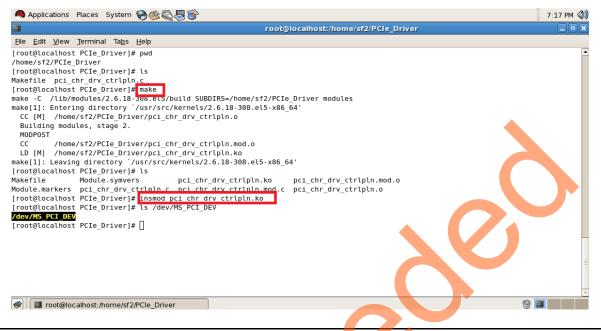

#### Figure 79 • Edit board.h File

- 7. To save the selected file, execute the :wg command
- 8. Change to PCle\_Driver/ directory using the cd command: #cd /home/sf2/PCIe\_Driver
- 9. To compile the Linux PCle device driver code, execute make command. #make clean [To clean any \*.o, \*.ko files] #make
- 10. The kernel module, pci\_chr\_drv\_ctrlpln.ko creates in the same directory.

11. To insert the Linux PCIe device driver as a module, execute insmod command. #insmod pci chr drv ctrlpln.ko

Note: Root privileges are required to execute this command.

### Figure 80 • PCIe Device Driver Installation

12. After successful Linux PCIe device driver installation, check /dev/MS\_PCI\_DEV got created by using the following Linux command:

#ls /dev/MS PCI DEV

Note: /dev/MS\_PCI\_DEV interface is used to access the SmartFusion2 PCIe end point from Linux user space.

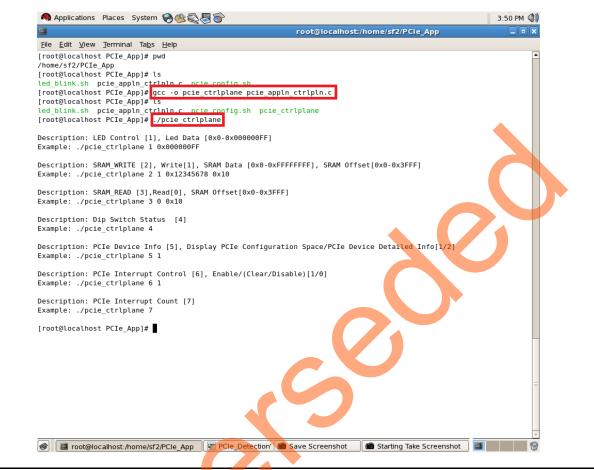

## Linux PCIe Application Compilation and PCIe Control Plane Utility Creation

- Change to the /home/sf2/ directory using the following command: #cd /home/sf2
- 2. Copy the M2S90\_PCIE\_Control\_DEMO\_DF\Linux\_64bit\Util\PCIe\_App folder from the Windows host PC and place it into the /home/sf2 directory of RedHat Linux host PC.
- 3. Change to the /home/sf2/PCle\_App directory using the following command:

#cd /home/sf2/PCIe\_App

- 4. Compile the Linux user space application pcie appln ctrlpln.c by using gcc command.
  - #gcc -o pcie\_ctrlplane pcie\_appln\_ctrlpln.c

### Figure 81 • Linux PCIe Application Utility

- 5. After successful compilation, Linux PCIe application utility pcie\_ctrlplane creates in the same directory.
- 6. On Linux Command Prompt run the pcie\_ctrlplane utility as:

#### #./pcie\_ctrlplane

Help menu displays as shown in Figure 81.

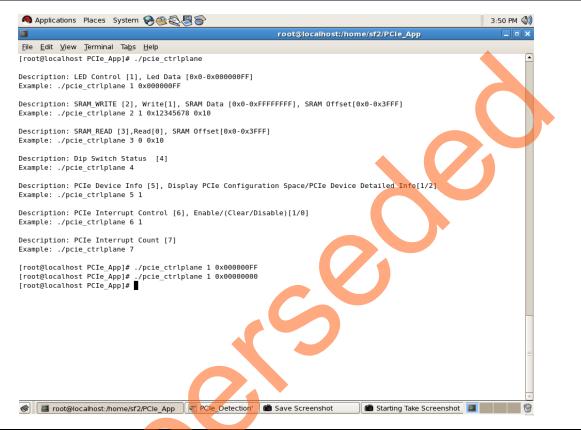

## **Execution of Linux PCIe Control Plane Features** LED Control

LED1 to LED8 is controlled by writing data to SmartFusion2 LED Control Registers.

```
#./pcie ctrlplane 1 0x00000FF [LED OFF]
```

#./pcie ctrlplane 1 0x00000000 [LED ON]

### Figure 82 • Linux Command - LED Control

led\_blink.sh, contains the shell script code to perform LED Walk ON where as Ctrl C exits the shell script and LED Walk turns OFF.

Run the led\_blink.sh shell script using sh command.

Figure 83 • Linux Command - SRAM Read/Write

SmartFusion2 SoC FPGA - PCIe Control Plane Demo

### **DIP Switch Status**

Dip Switch on SmartFusion2 Security Evaluation Kit consists of four electric switches to hold the device configurations. Linux PCIe utility reads the corresponding switches (ON/OFF) state.

DG0456: SmartFusion2 SoC FPGA PCIe Control Plane Demo - Libero SoC v11.6 Demo Guide

### PCIe Configuration Space Display

PCIe Configuration Space contains the PCIe device data, such as Vendor ID, Device ID, and Base Address 0.

### Note: Root Privileges are required to execute this command.

#./pcie\_ctrlplane 5 1 [Read PCIe Configuration Space]

SmartFusion2 SoC FPGA - PCIe Control Plane Demo

### PCIe Link Speed and Width

Note: Root Privileges are required to execute this command.

#./pcie\_ctrlplane 5 2 [Read PCIe Link Speed and Link Width]

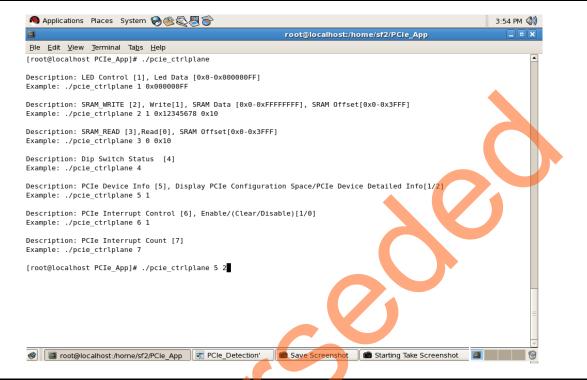

Figure 86 • Linux Command - PCIe Link Speed and Width

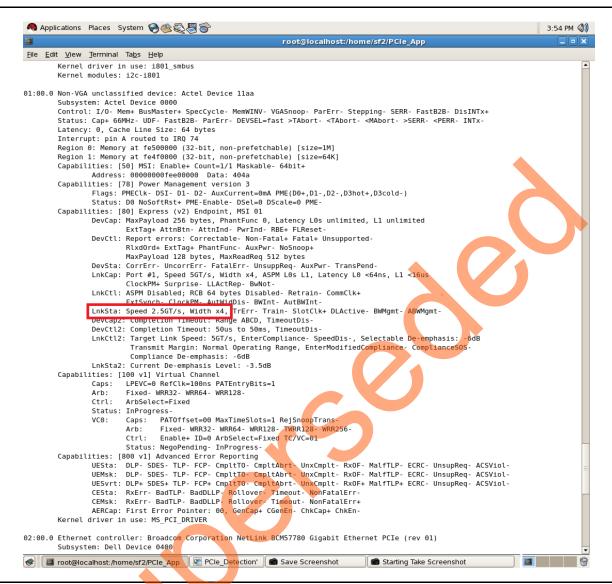

Figure 87 • Linux Command - PCle Link Speed and Width

### PCIe Interrupt Control (Enable/Disable) and Interrupt Counter

SmartFusion2 Security Evaluation Kit enable or disable the MSI interrupts by writing data to its PCIe configuration space.

Interrupt Counter holds the number of MSI interrupts got triggered by pressing the SW3 Push button.

- #. /pcie ctrlplane 6 0 [Disable Interrupts]
- #. /pcie\_ctrlplane 6 1 [Enable Interrupts]
- #. /pcie ctrlplane 7 [Interrupt Counter Value]

# Conclusion

This demo describes how to access the PCIe endpoint features of SmartFusion2, create a simple design, and verify the design using BFM simulation. This demo demonstrates that the Host PC can easily communicate with the SmartFusion2 Security Evaluation Kit through the provided GUI and Drivers. This demo also provides a Linux PCIe application for accessing PCIe EP device through Linux PCIe Device Driver.

# List of Changes

3

The following table lists the important changes that were made in each revision of the chapter in the demo guide.

Date	Changes	Page
Revision 5 (November 2015)	Updated the document for Libero v11.6 software release (SAR 73139).	NA
Revision 4 (February 2015)	Updated the document for Libero v11.5 software release (SAR 64184).	NA
Revision 3 (August 2014)	Updated the document for Libero v11.4 software release (SAR 59644).	NA
Revision 2 (April 2014)	Updated the document for Libero v11.3 software release (SAR 56081).	NA
Revision 1 (December 2013)	Updated the document for Libero v11.2 software release (SAR 52109) (SAR 52909) and (SAR 50779).	NA
Revision 0 (June 2013)	Initial Release	NA

# **Product Support**

Microsemi SoC Products Group backs its products with various support services, including Customer Service, Customer Technical Support Center, a website, electronic mail, and worldwide sales offices. This appendix contains information about contacting Microsemi SoC Products Group and using these support services.

## **Customer Service**

Contact Customer Service for non-technical product support, such as product pricing, product upgrades, update information, order status, and authorization.

From North America, call **800.262.1060** From the rest of the world, call **650.318.4460** Fax, from anywhere in the world, **650.318.8044** 

## **Customer Technical Support Center**

Microsemi SoC Products Group staffs its Customer Technical Support Center with highly skilled engineers who can help answer your hardware, software, and design questions about Microsemi SoC Products. The Customer Technical Support Center spends a great deal of time creating application notes, answers to common design cycle questions, documentation of known issues and various FAQs. So, before you contact us, please visit our online resources. It is very likely we have already answered your questions.

## **Technical Support**

For Microsemi SoC Products Support, visit http://www.microsemi.com/products/fpga-soc/design-support/fpga-soc-support.

## Website

You can browse a variety of technical and non-technical information on the Microsemi SoC Products Group home page, at http://www.microsemi.com/products/fpga-soc/fpga-and-soc.

# **Contacting the Customer Technical Support Center**

Highly skilled engineers staff the Technical Support Center. The Technical Support Center can be contacted by email or through the Microsemi SoC Products Group website.

## Email

You can communicate your technical questions to our email address and receive answers back by email, fax, or phone. Also, if you have design problems, you can email your design files to receive assistance. We constantly monitor the email account throughout the day. When sending your request to us, please be sure to include your full name, company name, and your contact information for efficient processing of your request.

The technical support email address is soc\_tech@microsemi.com.

DG0456: SmartFusion2 SoC FPGA PCIe Control Plane Demo - Libero SoC v11.6 Demo Guide

### **My Cases**

Microsemi SoC Products Group customers may submit and track technical cases online by going to My Cases.

### Outside the U.S.

Customers needing assistance outside the US time zones can either contact technical support via email (soc\_tech@microsemi.com) or contact a local sales office. Visit About Us for sales office listings and corporate contacts.

## **ITAR Technical Support**

For technical support on RH and RT FPGAs that are regulated by International Traffic in Arms Regulations (ITAR), contact us via soc\_tech@microsemi.com. Alternatively, within My Cases, select **Yes** in the ITAR drop-down list. For a complete list of ITAR-regulated Microsemi FPGAs, visit the ITAR web page.

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense & security, aerospace and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif., and has approximately 3,600 employees globally. Learn more at www.microsemi.com.

Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.
