#### About Microsemi

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions; security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, California, and has approximately 4,800 employees globally. Learn more at www.microsemi.com.

# **Timing Constraints Editor**

The Timing Constraints Editor enables you to create, view, and edit timing constraints. This editor includes powerful visual dialogs that guide you toward capturing your timing requirements and timing exceptions guickly and correctly.

Figure 1 · Constraints Editor

The Constraints Editor window is divided into a Constraint Browser, Constraint List, and a Constraint Adder.

# **Constraints Browser**

The Constraint Browser categorizes constraints based on three types of Constraints:

- **Requirements** General constraints to meet the design's timing requirements and specifications. Examples are clock constraints and generated clock constraints.
- Exceptions Constraints on certain timing paths for special considerations by SmartTime. Examples
  are false path constraints and multicycle path constraints.
- Advanced Special timing constraints such as clock latency and clock groups

# **Constraints List**

This is a spreadsheet-like list of the constraints with detailed values and parameters of the constraint displayed in individual cells. You may click on individual cells of the spreadsheet to change the values of the constraint parameters.

# **Constraints Adder**

This is the first row of the spreadsheet-like constraint list. There are 2 ways of adding a constraint from this row. User can right click on the row, and select Add Constraint to add a constraint of the same type to the Constraint List. This method will invoke the specific add constraint dialog.

Alternatively, user can select a cell by clicking in it. Then follow by double-clicking and start typing text. This method of creating a constraint is targeted at the experienced user who knows the design well, and need not rely on the dialog box for guidance.

You can perform the following tasks in the Constraints View:

- Select a constraint type from the Constraint Browser and create or edit the constraint.
- Add a new constraint and check the syntax.
- Right-click a constraint in the Constraints List to edit or delete.
- Use the first row to create a constraint (as described above), and add it to the main table (list)

# **Constraint Icons**

Across the top of the Constraint Editor is a list of icons you can click to add constraints. Tooltips are available to identify the constraints.

lcon	Name

# **Required Constraints**

# Set Clock Constraints

Adding a clock constraint is the most effective way to constrain and verify the timing behavior of a sequential design. Use clock constraints to meet your performance goals.

To set a clock constraint, open the Create Clock Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose **Clock**.
- Double-click the Add Clock Constraint icon
- Choose Clock from the Constraints drop-down menu (Constraints > Clock).
- Right-click the first row or any other row (if they exist) in the Clock Constraints Table and choose Add Clock Constraint.

The Create Clock Constraint dialog box appears.

lock Name :				Clock Source :		• •

Figure 3 · Select Source Pin for Clock Constraint Dialog Box

The Pin Type options are:

- Input Ports
- All Pins
- All Nets

Use the Select Source Pin for Clock Constraint dialog box to display a list of source pins from which you can choose. By default, it displays the Input Ports of the design.

To choose other pin types in the design as clock source pins, click the drop-down and choose **Input Ports**, **All Pins**, or **All Nets**. To display a subset of the displayed clock source pins, you can create and apply a filter. The default filter is \* (wild-card for all).

Click **OK** to save these dialog box settings.

#### **Period/Frequency**

Specifies the Period in nanoseconds (ns) or Frequency in MegaHertz (MHz). When you edit the period, the tool automatically updates the frequency value and vice versa. The frequency must be a positive real number. Accuracy is up to 3 decimal places.

#### Starting Clock Edge Selector

Click the Up or Down arrow to use the rising or falling edge as the starting edge for the created clock.

#### Offset

Indicates the shift (in nanoseconds) of the first clock edge with respect to instant zero common to all clocks in the design.

The offset value must be a positive real number. Accuracy is up to 2 decimal places. Default value is 0.

#### **Duty Cycle**

This number specifies the percentage of the overall period that the clock pulse is high. The duty cycle must be a positive real number. Accuracy is up to 4 decimal places. Default value is 50%.

# Set Generated Clock Constraints

Use the generated clock constraint to define an internally generated clock for your design and verify its timing behavior. Use generated clock constraints and clock constraints to meet your performance goals. To set a generated clock constraint, open the Create Generated Clock Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose Generated Clock.
- Double-click the Add Generated Clock Constraint icon
- Choose Generated Clock from the Constraints drop-down menu (Constraints > Generated Clock).

DO

• Right-click any row in the Generated Clock Constraints Table and choose Add Generated Clock Constraint.

Click **OK** to save the dialog box settings.

### **Generated Clock Name**

Specifies the name of the Generated clock constraint. This field is required for virtual clocks when no clock source is provided.

#### **Generated Frequency**

Specify the values to calculate the generated frequency: a multiplication factor and/or division factor (must be positive integers) is applied to the reference clock to compute the generated clock.

### **Generated Waveform**

Specify whether the generated waveform is the same or inverted with respect to the reference waveform. Click **OK**.

#### Phase

This field is primarily used to report the information captured from the CCC configuration process, and when constraint is auto-generated. Meaningful phase values are: 0, 45, 90, 135, 180, 225, 270, and 315. This field is used to report the information captured from the CCC configuration process, and when the constraint is auto-generated.

#### PLL Output

This field refers to the CCC GL0/1/2/3 output that is fed back to the PLL (in the CCC). This field is primarily used to report the information captured from the CCC configuration process, and when constraint is auto-generated.

PLL Feedback

This field refers to the manner in which the GL/0/1/2/3 output signal of the CCC is connected to the PLL's FBCLK input. This field is primarily used to report the information captured from the CCC configuration process, and when constraint is auto-generated.

# Set an Input Delay Constraint

٠

Use the input delay constraint to define the arrival time of an input relative to a clock.

To specify an input delay constraint, open the Add Input Delay Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose Input Delay.
  - Double-click the Add Input Delay Constraint icon
- Choose Input Delay from the Constraints drop-down menu (Constraints > Input Delay).
- Right-click any row in the Input Delay Constraints Table and choose Add Input Delay Constraint.

The Add Input Delay Constraint dialog box appears.

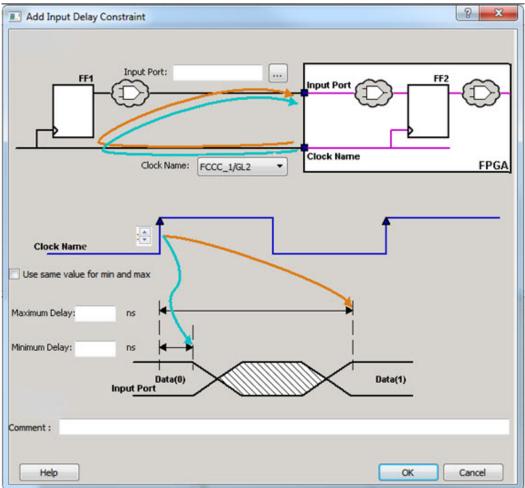

Figure 7 · Add Input Delay Constraint Dialog Box

The Input Delay Dialog Box enables you to enter an input delay constraint by specifying the timing budget outside the FPGA. You can enter the Maximum Delay, the Minimum Delay, or both.

### Input Port

Specify the Input Port or click the browse button next to Input Port to display the Select Ports for Input Delay dialog box. You can select multiple input ports on which to apply the input delay constraint.

# Set an Output Delay Constraint

Use the output delay constraints to define the output delay of an output relative to a clock. To specify an output delay constraint, open the Add Output Delay Constraint Dialog box in one of the following four ways:

- From the Constraints Browser, choose **Output Delay**.
- Double-click the Add Output Delay Constraint icon
- Choose Output Delay from the Constraints drop-down menu (Constraints > Output Delay).
- Right-click any row in the Output Delay Constraints Table and choose Add Output Delay Constraint.

The Add Output Delay Constraint dialog box appears.

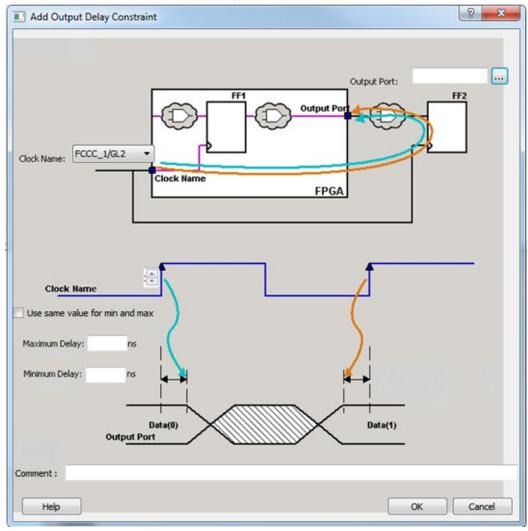

Figure 9 · Add Output Delay Constraint Dialog Box

The Output Delay dialog box enables you to enter an output delay constraint by specifying the timing budget outside the FPGA. You can enter the Maximum Delay, the Minimum Delay, or both.

#### **Output Port**

Specifies a list of output ports in the current design to which the constraint is assigned. You can select multiple output ports to apply the output delay constraints.

#### **Clock Name**

Specifies the clock reference to which the specified output delay is related.

#### **Clock edge Selector**

Use the Up or Down arrow to select the rising or falling edge as the launching edge of the clock.

#### Use Same Value for Min and Max

Check this checkbox to use the same delay value for Min and Max delay.

#### Maximum Delay

Specifies the delay in nanoseconds for the longest path from the specified output to the captured edge. This represents a combinational path delay to a register outside the current design plus the library setup time.

#### **Minimum Delay**

Specifies the delay in nanoseconds for the shortest path from the specified output to the captured edge. This represents a combinational path delay to a register outside the current design plus the library hold time.

set clock to ouput

# Exceptions

•

# Set a Maximum Delay Constraint

Set the options in the Maximum Delay Constraint dialog box to relax or to tighten the original clock constraint requirement on specific paths.

SmartTime automatically derives the individual maximum delay targets from clock waveforms and port input or output delays. So the maximum delay constraint is a timing exception. This constraint overrides the default single cycle timing relationship for one or more timing paths. This constraint also overrides a multiple cycle path constraint.

**Note**: When the same timing path has more than one timing exception constraint, SmartTime honors the timing constraint with the highest precedence and ignores the other timing exceptions according to the order of precedence shown.

Timing Exception Constraints	Order of Precedence
set_disable_timing	1
set_false_path	2
set_maximum_delay/set_minimum_delay	3
set_multicycle_path	4

**Note**: The set\_maximum\_delay\_constraint has a higher precedence over set\_multicycle\_path constraint and therefore the former overrides the latter when both constraints are set on the same timing path.

To set a Maximum Delay constraint, open the Set Maximum Delay Constraint Dialog box in one of the following four ways:

• From the Constraints Browser, choose Max Delay.

- Choose Max Delay from the Constraints drop-down menu (Constraints > Max Delay).
- From the Max Delay Constraints Table, right-click any row and choose Add Maximum Delay Constraint.

The Set Maximum Delay Constraint dialog box appears.

Figure 15 · Set Maximum Delay Constraint Dialog Box

# **Maximum Delay**

Specifies a floating point number in nanoseconds that represents the required maximum delay value for specified paths.

If the path starting point is on a sequential device, SmartTime includes clock skew in the computed delay.

If the path starting point has an input delay specified, SmartTime adds that delay value to the path delay.

If the path ending point is on a sequential device, SmartTime includes clock skew and library setup time in the computed delay.

If the ending point has an output delay specified, SmartTime adds that delay to the path delay.

### Source/From Pins

Specifies the starting points for max delay constraint path. A valid timing starting point is a clock, a primary input, an inout port, or a clock pin of a sequential cell.

To specify the Source pins(s), click on the Browse button to open the Select Source Pins for Max Delay Constraint dialog box.

# See Also

Timing Exceptions Overview

# Set a Minimum Delay Constraint

Set the options in the Mimimum Delay Constraint dialog box to relax or to tighten the original clock constraint requirement on specific paths.

SmartTime automatically derives the individual minimum delay targets from clock waveforms and port input or output delays. So the minimum delay constraint is a timing exception. This constraint overrides the default single cycle timing relationship for one or more timing paths. This constraint also overrides a multiple cycle path constraint.

**Note**: When the same timing path has more than one timing exception constraint, SmartTime honors the timing constraint with the highest precedence and ignores the other timing exceptions according to the order of precedence shown.

Timing Exception Constraints	Order of Precedence
set_disable_timing	1
set_false_path	2
set_maximum_delay/set_minimum_delay	3
set_multicycle_path	4

**Note**: The set\_maximum\_delay\_constraint has a higher precedence over set\_multicycle\_path constraint and therefore the former overrides the latter when both constraints are set on the same timing path.

To set a Minimum Delay constraint, open the Set Minimum Delay Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose Min Delay.
- Double-click the Add Min Delay Constraint icon
- Choose Min Delay from the Constraints drop-down menu (Constraints > Min Delay).
- Right click on any row in the Min Delay Constraints Table and select Add Minimum Delay Constraint.

The Set Minimum Delay Constraint dialog box appears.

Figure 19 · Set Minimum Delay Constraint Dialog Box

#### **Minimum Delay**

Specifies a floating point number in nanoseconds that represents the required minimum delay value for specified paths.

If the path starting point is on a sequential device, SmartTime includes clock skew in the computed delay.

If the path starting point has an input delay specified, SmartTime adds that delay value to the path delay.

If the path ending point is on a sequential device, SmartTime includes clock skew and library setup time in the computed delay.

If the ending point has an output delay specified, SmartTime adds that delay to the path delay.

#### Source Pins/From

Specifies the starting point for minimum delay constraint. A valid timing starting point is a clock, a primary input, an input port, or a clock pin of a sequential cell.

Click the browse button next to the "From" field to open the Select Source Pins for Min Delay Constraint dialog box.

## Set a Multicycle Constraint

Set the options in the Set Multicycle Constraint dialog box to specify paths that take multiple clock cycles in the current design.

Setting the multiple-cycle path constraint overrides the single-cycle timing relationships (the default) between sequential elements by specifying the number of cycles (two or more) that the data path must have for setup or hold checks.

**Note**: The false path information always takes precedence over multiple cycle path information. A specific maximum delay constraint overrides a general multiple cycle path constraint.

To set a multicycle constraint, open the Set Multicycle Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose Multicycle.
- Double-click the Add Multicycle Constraint icon
- Choose Multicycle from the Constraints drop-down menu (Constraints > Multicycle).
- Right-click any row in the Multicycle Constraints Table and choose Add Multicycle Path Constraint.

The Set Multicycle Constraint dialog box appears.

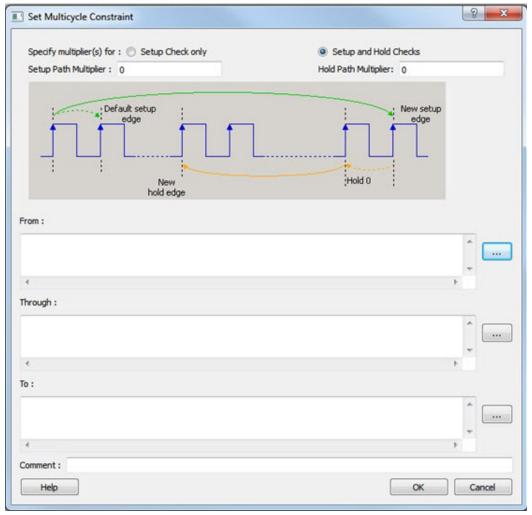

Figure 23 · Set Multicycle Constraint Dialog Box

#### Setup Check Only

Check this box to apply multiple clock cycle timing consideration for Setup Check only.

#### Setup and Hold Checks

Check this box to apply multiple clock cycle timing consideration for both Setup and Hold Checks.

#### Setup Path Multiplier

Specifies an integer value that represents the number of clock cycles (more than one) the data path must have for a setup check.

#### Hold Path Multiplier

Specifies an integer value that represents the number of clock cycles (more than one) the data path must have for a Hold check.

#### Source Pins/From Pins

Specifies the starting points for the multiple cycle path. A valid starting point is a clock, a primary input, an inout port, or the clock pin of a sequential cell.

Click the browse button next to the "From" field to open the Select Source Pins for Multicycle Constraint dialog box.

Specifying a Multicycle Constraint set multicycle path (SDC)

## Set a False Path Constraint

Set options in the Set False Path Constraint dialog box to define specific timing paths as false path.

This constraint removes timing requirements on these false paths so that they are not considered during the timing analysis. The path starting points are the input ports or register clock pins and path ending points are the register data pins or output ports. This constraint disables setup and hold checking for the specified paths.

**Note**: When the same timing path has more than one timing exception constraint, SmartTime honors the timing constraint with the highest precedence and ignores the other timing exceptions according to the order of precedence shown below.

Timing Exception Constraints	Order of Precedence
set_disable_timing	1
set_false_path	2
set_maximum_delay/set_minimum_delay	3
set_multicycle_path	4

**Note**: The set\_false\_path constraint has the second highest precedence and always overrides the set\_multicycle\_path constraints and set\_maximum/minimum\_delay constraints.

To set a false path constraint, open the Set False Path Constraint dialog box in one of the following four ways:

• From the Constraints Browser, choose **False Path**.

- Double-click the Add False Path Constraint icon
- Choose False Path from the Constraints drop-down menu (Constraints > False Path).
- Right-click any row in the False Path Constraints Table and choose Add False Path Constraint.

The Set False Path Constraint dialog box appears.

# **Advanced Constraints**

## Set a Disable Timing Constraint

Use disable timing constraint to specify the timing arcs to be disabled for timing consideration.

**Note**: This constraint is for the Place and Route tool and the Verify Timing tool. It is ignored by the Synthesis tool.

To specify a Disable Timing constraint, open the Set Constraint to Disable Timing Arcs dialog box in one of the following four ways:

- From the Constraints Browser, choose Advanced > Disable Timing.
- Double-click the Add Disable Timing Constraint icon
- Choose Disable Timing from the Constraints drop-down menu (Constraints > Disable Timing).
- Right-click any row in the Disable Timing Constraints Table and choose Add Constraint to Disable Timing.

The Set Constraint to Disable Timing Arcs dialog box appears.

#### **Exclude All Timing Arcs in the Instance**

This option enables you to exclude all timing arcs in the specified instance.

#### Specify Timing Arc to Exclude

This option enables you to specify the timing arc to exclude. In this case, you need to specify the from and to ports:

### From Port

Specifies the starting point for the timing arc.

### To Port

Specifies the ending point for the timing arc.

#### Comment

Enter a one-line comment for the constraint.

See Also Specifying Disable Timing Constraint •

## Set Clock Source Latency Constraint

Use clock source latency constraint to specify the delay from the clock generation point to the clock definition point in the design.

Clock source latency defines the delay between an external clock source and the definition pin of a clock. It behaves much like an input delay constraint.

You can specify both an "early" delay and a "late" delay for this latency, providing an uncertainty which the timing analyzer can use for propagating through its calculations. Rising and falling edges of the same clock can have different latencies. If only one value is provided for the clock source latency, it is taken as the exact latency value, for both rising and falling edges.

To specify a Clock Source Latency constraint, open the Set Clock Source Latency Constraint dialog box in one of the following four ways:

- From the Constraints Browser, choose Clock Source Latency.
  - Double-click the Clock Source Latency Constraint icon
- Choose Clock Source Latency from the Constraints drop-down menu (Constraints > Advanced > Clock Source Latency).
- Right-click any row of the Clock Latency Constraints Table and choose Add Clock Source Latency.

The Set Clock Source Latency Constraint dialog box appears.

Clock Name or Source:			• •••
Clock Source			
Late Rise ns	- ×	Late Fall	ns
Early Rise ns		Early Fall	ns

Citer available	
Filter available Pin Type :	Clock Pins 👻

Figure 34 · Choose the Clock Source Pin Dialog Box

The only choice available for Pin Type is Clock Pins.

#### Late Rise

Specifies the largest possible latency, in nanoseconds, of the rising clock edge at the clock port or pin selected, with respect to its source. Negative values are acceptable, but may lead to overly optimistic analysis.

#### Early Rise

Specifies the smallest possible latency, in nanoseconds, of the rising clock edge at the clock port or pin selected, with respect to its source. Negative values are acceptable, but may lead to overly optimistic analysis.

#### Late Fall

Specifies the largest possible latency, in nanoseconds, of the falling clock edge at the clock port or pin selected, with respect to its source. Negative values are acceptable, but may lead to overly optimistic analysis.

#### Early Fall

Specifies the smallest possible latency, in nanoseconds, of the falling clock edge at the clock port or pin selected, with respect to its source. Negative values are acceptable, but may lead to overly optimistic analysis.

#### **Clock Edges**

Select the latency for the rising and falling edges:

Falling same as rising: Specifies that Rising and Falling clock edges have the same latency.

Early same as late: Specifies that the clock source latency should be considered as a single value, not a range from "early" to '"late".

#### Comment

Enter a one-line comment to describe the clock source latency.

# **Referenced Topics**

## create\_clock

SDC command; creates a clock and defines its characteristics.

create\_clock -name name -period period\_value [-waveform edge\_list] source

## **Arguments**

#### -name *nam*e

Specifies the name of the clock constraint. This parameter is required for virtual clocks when no clock source is provided.

#### -period *period\_value*

Specifies the clock period in nanoseconds. The value you specify is the minimum time over which the clock waveform repeats. The period\_value must be greater than zero.

#### -waveform edge\_list

Specifies the rise and fall times of the clock waveform in ns over a complete clock period. There must be exactly two transitions in the list, a rising transition followed by a falling transition. You can define a clock starting with a falling edge by providing an edge list where fall time is less than rise time. If you do not specify -waveform option, the tool creates a default waveform, with a rising edge at instant 0.0 ns and ©a falling edge at instant (period\_value/2)ns.

#### source

Specifies the source of the clock constraint. The source can be ports or pins in the design. If you specify a clock constraint on a pin that already has a clock, the new clock replaces the existing one. Only one source is accepted. Wildcards are accepted as long as the resolution shows one port or pin.

## **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire, SmartFusion, IGLOO, ProASIC3, Fusion

## **Description**

Creates a clock in the current design at the declared source and defines its period and waveform. The static timing analysis tool uses this information to propagate the waveform across the clock network to the clock pins of all sequential elements driven by this clock source.

The clock information is also used to compute the slacks in the specified clock domain that drive optimization tools such as place-and-route.

## **Exceptions**

• None

#### Examples

The following example creates two clocks on ports CK1 and CK2 with a period of 6, a rising edge at 0, and a falling edge at 3:

```
create_clock -name {my_user_clock} -period 6 CK1
create_clock -name {my_other_user_clock} -period 6 -waveform {0 3} {CK2}
The following example creates a clock on port CK3 with a period of 7, a rising edge at 2, and a falling
edge at 4:
areate clock period 7, waveform {2,4} [get perto [CK2]]
```

```
create_clock -period 7 -waveform {2 4} [get_ports {CK3}]
```

## **Microsemi Implementation Specifics**

The -waveform in SDC accepts waveforms with multiple edges within a period. In Microsemi design
implementation, only two waveforms are accepted.

- SDC accepts defining a clock on many sources using a single command. In Microsemi design implementation, only one source is accepted.
- The source argument in SDC create\_clock command is optional. This is in conjunction with the -name argument in SDC to support the concept of virtual clocks. In Microsemi implementation, source is a mandatory argument as -name and virtual clocks concept is not supported.
- The -domain argument in the SDC create\_clock command is not supported.

#### See Also

Constraint Support by Family Constraint Entry Table SDC Syntax Conventions Clock Definition Create Clock Create a New Clock Constraint

## create\_generated\_clock

SDC command; creates an internally generated clock and defines its characteristics.

```
create_generated_clock -name {name -source reference_pin [-divide_by divide_factor] [-
multiply_by multiply_factor] [-invert] source -pll_output pll_feedback_clock -pll_feedback
pll_feedback_input
```

## Arguments

#### -name name

Specifies the name of the clock constraint. This parameter is required for virtual clocks when no clock source is provided.

-source reference\_pin

Specifies the reference pin in the design from which the clock waveform is to be derived.

-divide\_bydivide\_factor

Specifies the frequency division factor. For instance if the *divide\_factor* is equal to 2, the generated clock period is twice the reference clock period.

-multiply\_by multiply\_factor

Specifies the frequency multiplication factor. For instance if the *multiply\_factor* is equal to 2, the generated clock period is half the reference clock period.

-invert

Specifies that the generated clock waveform is inverted with respect to the reference clock.

source

Specifies the source of the clock constraint on internal pins of the design. If you specify a clock constraint on a pin that already has a clock, the new clock replaces the existing clock. Only one source is accepted. Wildcards are accepted as long as the resolution shows one pin.

-pll\_output pll\_feedback\_clock

Specifies the output pin of the PLL which is used as the external feedback clock. This pin must drive the feedback input pin of the PLL specified using the -pll\_feedback option. The PLL will align the rising edge of the reference input clock to the feedback clock. This is a mandatory argument if the PLL is operating in external feedback mode.

-pll\_feedback pll\_feedback\_input

Specifies the feedback input pin of the PLL. This pin must be driven by the output pin of the PLL specified using the -pll\_output option. The PLL will align the rising edge of the reference input clock to the external feedback clock. This is a mandatory argument if the PLL is operating in external feedback mode.

## **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire, SmartFusion, IGLOO, ProASIC3, Fusion

## Description

Creates a generated clock in the current design at a declared source by defining its frequency with respect to the frequency at the reference pin. The static timing analysis tool uses this information to compute and propagate its waveform across the clock network to the clock pins of all sequential elements driven by this source.

The generated clock information is also used to compute the slacks in the specified clock domain that drive optimization tools such as place-and-route.

## **Examples**

The following example creates a generated clock on pin U1/reg1:Q with a period twice as long as the period at the reference port CLK.

```
create_generated_clock -name {my_user_clock} -divide_by 2 -source [get_ports {CLK}] U1/reg1/Q
```

The following example creates a generated clock at the primary output of myPLL with a period <sup>3</sup>/<sub>4</sub> of the period at the reference pin clk.

create\_generated\_clock -divide\_by 3 -multiply\_by 4 -source clk [get\_pins {myPLL/CLK1}] The following example creates a generated clock named system\_clk on the GL2 output pin of FCCC\_0 with a period equal to half the period of the source clock. The constraint also identifies GL2 output pin as the

```
create_generated_clock -name { system_clk } \
-multiply_by 2 \
-source { FCCC_0/CCC_INST/CLK3_PAD } \
-pll_output { FCCC_0/CCC_INST/GL2 } \
-pll_feedback { FCCC_0/CCC_INST/CLK2 } \
{ FCCC_0/CCC_INST/GL2 }
```

external feedback clock source and CLK2 as the feedback input pin for FCCC 0.

## **Microsemi Implementation Specifics**

- SDC accepts either –multiply\_by or –divide\_by option. In Microsemi design implementation, both are
  accepted to accurately model the PLL behavior.
- SDC accepts defining a generated clock on many sources using a single command. In Microsemi design implementation, only one source is accepted.
- The -duty\_cycle ,-edges and -edge\_shift options in the SDC create\_generated\_clock command are not supported in Microsemi design implementation.

# Specifying Generated Clock Constraints

Specifying a generated clock constraint enables you to define an internally generated clock for your design and verify its timing behavior. Use generated clock constraints and <u>clock constraints</u> to meet your performance goals.

### To specify a generated clock constraint:

- 1. Open the Create Generated Clock Constraint dialog box using one of the following methods:
  - Click the micon.
  - Right-click the GeneratedClock in the Constraint Browser and choose Add Generated Clock.
  - Double-click the Generated Clock Constraints grid. The Create Generated Clock Constraint dialog box appears (as shown below).

Create Generated Clock Constraint	×
Clock Reference:	
Clock Port FPGA	
Generated Clock Name	
The generated frequency is such as	
f(clock) = f(reference) x 1 / 1 Get Pre-Computed Factor	rs
The generated waveform is the same as 💌 the reference waveform

- 3. Modify the Clock Name if necessary.
- 4. Click **OK** to save these dialog box settings.
- 5. Specify a **Clock Reference**. To display a list of available clock reference pins, click the **Browse** button. The <u>Select Generated Clock Reference</u> dialog box appears.
- 5. Click **OK** to save this dialog box settings.
- 6. Specify the values to calculate the generated frequency: a multiplication factor and/or a division factor (both positive integers).
- 7. Specify the first edge of the generated waveform either same as or inverted with respect to the reference waveform.
- 8. Click OK. The new constraint appears in the Constraints List.
- Tip: Tip: From the File menu, choose Saveto save the newly created constraint in the database.

Specifying generated clock constraint (SDC)

## set\_input\_delay

SDC command; defines the arrival time of an input relative to a clock.

set\_input\_delay delay\_value -clock clock\_ref [-max] [-min] [-clock\_fall] input\_list

## Arguments

delay\_value

Specifies the arrival time in nanoseconds that represents the amount of time for which the signal is available at the specified input after a clock edge.

-clock clock\_ref

Specifies the clock reference to which the specified input delay is related. This is a mandatory argument. If you do not specify -max or -min options, the tool assumes the maximum and minimum input delays to be equal.

-max

Specifies that delay\_value refers to the longest path arriving at the specified input. If you do not specify - max or -min options, the tool assumes maximum and minimum input delays to be equal.

-min

Specifies that delay\_value refers to the shortest path arriving at the specified input. If you do not specify - max or -min options, the tool assumes maximum and minimum input delays to be equal.

-clock\_fall

Specifies that the delay is relative to the falling edge of the clock reference. The default is the rising edge.

input\_list

Provides a list of input ports in the current design to which delay\_value is assigned. If you need to specify more than one object, enclose the objects in braces ({}).

#### **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire, SmartFusion, IGLOO, ProASIC3, Fusion and IGLOOe, except ProASIC3 nano and ProASIC3L

## Description

The set\_input\_delay command sets input path delays on input ports relative to a clock edge. This usually represents a combinational path delay from the clock pin of a register external to the current design. For in/out (bidirectional) ports, you can specify the path delays for both input and output modes. The tool adds input delay to path delay for paths starting at primary inputs.

A clock is a singleton that represents the name of a defined clock constraint. This can be:

- a single port name used as source for a clock constraint
- a single pin name used as source for a clock constraint; for instance reg1:CLK. This name can be hierarchical (for instance toplevel/block1/reg2:CLK)
- an object accessor that will refer to one clock: [get\_clocks {clk}]

## **Examples**

The following example sets an input delay of 1.2ns for port data1 relative to the rising edge of CLK1: set\_input\_delay 1.2 -clock [get\_clocks CLK1] [get\_ports data1]

The following example sets a different maximum and minimum input delay for port IN1 relative to the falling edge of CLK2:

set\_input\_delay 1.0 -clock\_fall -clock CLK2 -min {IN1}
set\_input\_delay 1.4 -clock\_fall -clock CLK2 -max {IN1}

## **Microsemi Implementation Specifics**

In SDC, the -clock is an optional argument that allows you to set input delay for combinational designs. Microsemi Implementation currently requires this argument.

#### See Also

Constraint Support by Family Constraint Entry Table SDC Syntax Conventions Set Input Delay

## set\_output\_delay

SDC command; defines the output delay of an output relative to a clock.

set\_output\_delay delay\_value -clock clock\_ref [-max] [-min] [-clock\_fall] output\_list

## **Arguments**

#### delay\_value

Specifies the amount of time before a clock edge for which the signal is required. This represents a combinational path delay to a register outside the current design plus the library setup time (for maximum output delay) or hold time (for minimum output delay).

-clock clock\_ref

Specifies the clock reference to which the specified output delay is related. This is a mandatory argument. If you do not specify -max or -min options, the tool assumes the maximum and minimum input delays to be equal.

-max

Specifies that delay\_value refers to the longest path from the specified output. If you do not specify -max or -min options, the tool assumes the maximum and minimum output delays to be equal.

Specifies that delay\_value refers to the shortest path from the specified output. If you do not specify -max or -min options, the tool assumes the maximum and minimum output delays to be equal.

-clock\_fall

Specifies that the delay is relative to the falling edge of the clock reference. The default is the rising edge. output\_list

Provides a list of output ports in the current design to which delay\_value is assigned. If you need to specify more than one object, enclose the objects in braces ({}).

## **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire, SmartFusion, IGLOO, ProASIC3, Fusion

## Description

The set\_output\_delay command sets output path delays on output ports relative to a clock edge. Output ports have no output delay unless you specify it. For in/out (bidirectional) ports, you can specify the path delays for both input and output modes. The tool adds output delay to path delay for paths ending at primary outputs.

#### **Examples**

The following example sets an output delay of 1.2ns for port OUT1 relative to the rising edge of CLK1:

set\_output\_delay 1.2 -clock [get\_clocks CLK1] [get\_ports OUT1]

The following example sets a different maximum and minimum output delay for port OUT1 relative to the falling edge of CLK2:

set\_output\_delay 1.0 -clock\_fall -clock CLK2 -min {OUT1}
set\_output\_delay 1.4 -clock\_fall -clock CLK2 -max {OUT1}

## **Microsemi Implementation Specifics**

 In SDC, the -clock is an optional argument that allows you to set the output delay for combinational designs. Microsemi Implementation currently requires this option.

### See Also

Constraint Support by Family Constraint Entry Table SDC Syntax Conventions Set Output Delay

## set\_clock\_to\_output

SDC command; defines the timing budget available inside the FPGA for an output relative to a clock.

set\_clock\_to\_output delay\_value -clock clock\_ref [-max] [-min] output\_list

## Arguments

#### delay\_value

Specifies the clock to output delay in nanoseconds. This time represents the amount of time available inside the FPGA between the active clock edge and the data change at the output port.

-clock clock\_ref

Specifies the reference clock to which the specified clock to output is related. This is a mandatory argument.

-max

Specifies that *delay\_value* refers to the maximum clock to output at the specified output. If you do not specify -max or -min options, the tool assumes maximum and minimum clock to output delays to be equal.

-min

Specifies that *delay\_value* refers to the minimum clock to output at the specified output. If you do not specify -max or -min options, the tool assumes maximum and minimum clock to output delays to be equal.

#### output\_list

Provides a list of output ports in the current design to which delay\_value is assigned. If you need to specify more than one object, enclose the objects in braces ({}).

## **Supported Families**

See the Tcl Commands and Supported Families table for the list of families that support this command.

# **Timing Exceptions Overview**

Use timing exceptions to overwrite the default behavior of the design path. Timing exceptions include:

- Setting multicycle constraint to specify paths that (by design) will take more than one cycle.
- Setting a false path constraint to identify paths that must not be included in the timing analysis or the optimization flow.
- Setting a maximum delay constraint on specific paths to relax or to tighten the original clock constraint requirement.

## set\_min\_delay

SDC command; specifies the minimum delay for the timing paths.

set\_min\_delay delay\_value [-from from\_list] [-to to\_list]

## Arguments

#### delay\_value

Specifies a floating point number in nanoseconds that represents the required minimum delay value for specified paths.

- If the path starting point is on a sequential device, the tool includes clock skew in the computed delay.
- If the path starting point has an input delay specified, the tool adds that delay value to the path delay.
- If the path ending point is on a sequential device, the tool includes clock skew and library setup time in the computed delay.
- If the ending point has an output delay specified, the tool adds that delay to the path delay.

#### -from from\_list

Specifies a list of timing path starting points. A valid timing starting point is a clock, a primary input, an inout port, or a clock pin of a sequential cell.

-to to\_list

Specifies a list of timing path ending points. A valid timing ending point is a clock, a primary output, an inout port, or a data pin of a sequential cell.

#### **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire, SmartFusion, IGLOO, ProASIC3, Fusion

#### Description

This command specifies the required minimum delay for timing paths in the current design. The path length for any startpoint in from\_list to any endpoint in to\_list must be less than delay\_value. The tool automatically derives the individual minimum delay targets from clock waveforms and port input or output delays. For more information, refer to the <u>create\_clock</u>, <u>set\_input\_delay</u>, and <u>set\_output\_delay</u> commands.

The minimum delay constraint is a timing exception. This constraint overrides the default single cycle timing relationship for one or more timing paths. This constraint also overrides a multicycle path constraint.

#### **Examples**

The following example sets a minimum delay by constraining all paths from ff1a:CLK or ff1b:CLK to ff2e:D with a delay less than 5 ns:

set\_min\_delay 5 -from {ffla:CLK fflb:CLK} -to {ff2e:D}

The following example sets a minimum delay by constraining all paths to output ports whose names start by "out" with a delay less than 3.8 ns:

set\_min\_delay 3.8 -to [get\_ports out\*]

## **Microsemi Implementation Specifics**

The -through option in the set\_min\_delay SDC command is not supported.

1 For Libero SoC Design Flov 2 For Libero SoC Design Flov		- SmartFusion2, IGLOO2, R	TG4, and PolarFire

## Purpose

Use this constraint to identify paths in the design that take multiple clock cycles.

You can set multicycle path constraints in an SDC file, which you can either create yourself or generate with Synthesis tools, at the same time you import the netlist. Alternatively, you can set multicycle paths using the GUI tools in the Designer software when you implement your design.

## **Tools /How to Enter**

You can use one or more of the following commands or GUI tools to set multicycle paths constraints:

- SDC set\_multicycle\_path
- SmartTime <u>Specifying Input Delay Constraint</u>

#### See Also

<u>Constraint Entry</u> <u>set\_multicycle\_paths</u> (SDC) <u>Specifying Input Delay Constraint</u>

# Specifying a Multicycle Constraint

You set options in the <u>Set Multicycle Constraint</u> dialog box to specify paths that take multiple clock cycles in the current design.

#### To specify multicycle constraints:

- 1. Add the constraint in the <u>Editable Constraints Grid</u> or open the <u>Set Multicycle Constraint</u> dialog box using one of the following methods:
  - From the SmartTime Constraints Editor, choose Constraint > MultiCycle.
  - Click the ticon.
  - Right-click the **Multicycle** option in the Constraint Browser and select **Add Multicycle Path Constraint**.

The Set Multicycle Constraint dialog box appears (as shown below).

# Specifying a False Path Constraint

You set options in the Set False Path Constraint dialog box to define specific timing paths as false.

#### To specify False Path constraints:

- 1. Add the constraint in the <u>Editable Constraints Grid</u> or open the <u>Set False Path Constraint</u> dialog box. You can do this by using one of the following methods:
  - From the SmartTime Constraints menu, choose False Path.
  - Click the icon.
  - Right-click False Path in the Constraint Browser and choose Add False Path Constraint.

The Set False Path Constraint dialog box appears (as shown below).

# Set False Path

## **Families Supported**

The following table shows which families support this constraint and which file formats and tools you can use to enter or modify it:

Families	SDC	SmartTime	Constraints Editor				
PolarFire	х		X <sup>2</sup>				
RTG4	х	X <sup>1</sup>	X <sup>2</sup>				
IGLOO2	х	X <sup>1</sup>	X <sup>2</sup>				
SmartFusion2	х	X <sup>1</sup>	X <sup>2</sup>				
IGLOO	х	Х					
SmartFusion	х	Х					
Fusion	х	Х					
ProASIC3	х	Х					
1 For Libero SoC Design Flow (Classic Constraint Flow)							

2 For Libero SoC Design Flow (Enhanced Constraint Flow) -SmartFusion2, IGLOO2, RTG4, and PolarFire

## **Purpose**

Use this constraint to identify paths in the design that should be disregarded during timing analysis and timing optimization.

By definition, false paths are paths that cannot be sensitized under any input vector pair. Therefore, including false paths in timing calculation may lead to unrealistic results. For accurate static timing analysis, it is important to identify the false paths.

You can set false paths constraints in an SDC file, which you can either create yourself or generate with Synthesis tools, at the same time you import the netlist.

## **Tools /How to Enter**

You can use one or more of the following commands or GUI tools to set false paths:

- SDC <u>set\_false\_path</u>
- SmartTime Specifying False Path Constraint

#### See Also

<u>Constraint Entry</u> <u>set\_false\_path</u> (SDC) <u>Breaks Tab</u> <u>Specifying False Path Constraint</u>

# Specifying Disable Timing Constraint

Use disable timing constraint to specify the timing arcs being disabled.

#### To specify the disable timing constraint:

- 1. Add the constraint in the <u>Editable Constraints Grid</u> or open the <u>Set Constraint to Disable Timing Arcs</u> <u>Dialog Box</u> using one of the following methods:
  - From the SmartTime Constraints Editor, choose Constraints > Disable Timing.
  - Click the 🔯 icon in the Constraints Editor.
  - In the Constraints Editor, right-click Disable Timing and choose Add Constraints to disable timing ..
- 2. Select an instance from your design.
- 3. Select whether you want to exclude all timing arcs in the instance or if you want to specify the timing arc to exclude. If you selected specify timing arc to exclude, select a from and to port for the timing arc.
- 4. Enter any comments to be attached to the constraint.
- 5. Click OK. The new constraint appears in the constraints list.
  - **Note:** When you choose Save from the File menu, SmartTime saves the newly-created constraint in the database.

#### See Also

Set Constraint to Disable Timing Arcs Dialog Box

# **Specifying Clock Constraints**

Specifying clock constraints is the most effective way to constrain and verify the timing behavior of a sequential design. Use clock constraints to meet your performance goals.

#### To specify a clock constraint:

- 1. Add the constraint in the <u>editable constraints grid</u> or open the <u>Create Clock Constraint</u> dialog box using one of the following methods:
  - Click the icon in the Constraints Editor.
  - Right-click the Clock in the Constraint Browser and choose Add Clock Constraint.
  - Double-click Clock in the Constraint Browser.

The Create Clock Constraint dialog box appears (as shown below).

Create Clock Constraint		<u>Zega zega</u>		?	×
Clock Name :		Clock Source :		•	
	Period :	ns — 🕨	or Frequency:		Mhz
← Offset : → ← Du     0.000 ns 50. Comment :	ity cycle :► 00000 %				
Help			ОК	Canc	el

Figure 66 · Create Clock Constraint Dialog Box

- 2. Select the pin to use as the clock source. You can click the **Browse** button to display the <u>Select</u> <u>Source Pins for Clock Constraint Dialog Box</u> (as shown below).
  - **Note:** Do not select a source pin when you specify a virtual clock. Virtual clocks can be used to define a clock outside the FPGA that it is used to synchronize I/Os.

Use the Choose the Clock Source Pin dialog box to display a list of source pins from which you can choose. By default, it displays the explicit clock sources of the design. To choose other pins in the design as clock source pins, select **Filter available objects - Pin Type** as **Explicit clocks**, **Potential clocks**, **All Ports**, **All Pins**, **All Nets**, **Pins on clock network**, or **Nets in clock network**. To display a subset of the displayed clock source pins, you can create and apply a filter.

Multiple source pins can be specified for the same clock when a single clock is entering the FPGA using multiple inputs with different delays.

Click  $\ensuremath{\text{OK}}$  to save these dialog box settings.

- 3. Specify the Period in nanoseconds (ns) or Frequency in megahertz (MHz).
- 4. Modify the Clock Name. The name of the first clock source is provided as default.
- 5. Modify the Duty cycle, if needed.
- 6. Modify the **Offset** of the clock, if needed.
- 7. Modify the first edge direction of the clock, if needed.
- 8. Click **OK**. The new constraint appears in the Constraints List.

Note: When you choose File > Save, SmartTime saves the newly created constraint in the database.

## See Also <u>Clock</u> definition <u>Create a Clock</u> <u>Create Clock Constraint Dialog Box</u>

## set\_clock\_uncertainty

Tcl command; specifies a clock-to-clock uncertainty between two clocks (from and to) and returns the ID of the created constraint if the command succeeded.

```
set_clock_uncertainty uncertainty -from | -rise_from | -fall_from from_clock_list -to | -
rise_to | -fall_to to_clock_list -setup {value} -hold {value}
```

## Arguments

#### uncertainty

Specifies the time in nanoseconds that represents the amount of variation between two clock edges. -from

Specifies that the clock-to-clock uncertainty applies to both rising and falling edges of the source clock list. Only one of the <code>-from, -rise\_from, or -fall\_from</code> arguments can be specified for the constraint to be valid.

-rise\_from

Specifies that the clock-to-clock uncertainty applies only to rising edges of the source clock list. Only one of the -from, -rise\_from, or -fall\_from arguments can be specified for the constraint to be valid. -fall\_from

Specifies that the clock-to-clock uncertainty applies only to falling edges of the source clock list. Only one of the -from, -rise\_from, or -fall\_from arguments can be specified for the constraint to be valid.

#### from\_clock\_list

Specifies the list of clock names as the uncertainty source.

#### -to

Specifies that the clock-to-clock uncertainty applies to both rising and falling edges of the destination clock list. Only one of the -to, -rise\_to , or -fall\_to arguments can be specified for the constraint to be valid. -rise\_to

Specifies that the clock-to-clock uncertainty applies only to rising edges of the destination clock list. Only one of the -to, -rise\_to, or -fall\_to arguments can be specified for the constraint to be valid. -fall\_to

Specifies that the clock-to-clock uncertainty applies only to falling edges of the destination clock list. Only one of the -to,  $-rise_to$ , or  $-fall_to$  arguments can be specified for the constraint to be valid.

#### $to\_clock\_list$

Specifies the list of clock names as the uncertainty destination.

#### -setup

Specifies that the uncertainty applies only to setup checks. If none or both -setup and -hold are present, the uncertainty applies to both setup and hold checks.

-hold

Specifies that the uncertainty applies only to hold checks. If none or both -setup and -hold are present, the uncertainty applies to both setup and hold checks.

#### **Supported Families**

See the <u>Tcl Commands and Supported Families</u> table for the list of families that support this command.

#### Description

The set\_clock\_uncertainty command sets the timing uncertainty between two clock waveforms or maximum clock skew. Timing between clocks have no uncertainty unless you specify it.

## **Examples**

```
set_clock_uncertainty 10 -from Clk1 -to Clk2
set_clock_uncertainty 0 -from Clk1 -fall_to { Clk2 Clk3 } -setup
set_clock_uncertainty 4.3 -fall_from { Clk1 Clk2 } -rise_to *
set_clock_uncertainty 0.1 -rise_from [ get_clocks { Clk1 Clk2 } ] -fall_to { Clk3 Clk4 }
-setup
set_clock_uncertainty 5 -rise_from Clk1 -to [ get_clocks {*} ]
```

### See Also

create\_clock
create\_generated\_clock

## set\_clock\_groups

set\_clock\_groups is an SDC command which disables timing analysis between the specified clock groups. No paths are reported between the clock groups in both directions. Paths between clocks in the same group continue to be reported.

```
set_clock_groups [-name name]
    [-physically_exclusive | -logically_exclusive | -asynchronous]
    [-comment_comment_string]
    -group clock_list
```

**Note**: If you use the same name and the same exclusive flag of a previously defined clock group to create a new clock group, the previous clock group is removed and a new one is created in its place.

## Arguments

#### -name *nam*e

Name given to the clock group. Optional.

-physically\_exclusive

Specifies that the clock groups are physically exclusive with respect to each other. Examples are multiple clocks feeding a register clock pin. The exclusive flags are all mutually exclusive. Only one can be specified.

-logically\_exclusive

Specifies that the clocks groups are logically exclusive with respect to each other. Examples are clocks passing through a mux.

-asynchronous

Specifies that the clock groups are asynchronous with respect to each other, as there is no phase relationship between them. The exclusive flags are all mutually exclusive. Only one can be specified.

Note: The exclusive flags for the arguments above are all mutually exclusive. Only one can be specified.

-group clock\_list

Specifies a list of clocks. There can any number of groups specified in the set\_clock\_groups command.

## **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire

## Example

set\_clock\_groups -name mygroup3 -physically\_exclusive \
-group [get\_clocks clk\_1] -group [get\_clocks clk\_2]

## See Also

list clock groups remove\_clock\_groups

## set\_false\_path

Tcl command; identifies paths that are considered false and excluded from the timing analysis in the current timing scenario.

set\_false\_path [-from from\_list] [-through through\_list] [-to to\_list]

#### **Arguments**

-from from\_list

Specifies a list of timing path starting points. A valid timing starting point is a clock, a primary input, an inout port, or a clock pin of a sequential cell.

-through through\_list

Specifies a list of pins, ports, cells, or nets through which the disabled paths must pass.

-to *to\_list* 

Specifies a list of timing path ending points. A valid timing ending point is a clock, a primary output, an inout port, or a data pin of a sequential cell.

### **Supported Families**

See the <u>Tcl Commands and Supported Families</u> table for the list of families that support this command.

### Description

The set\_false\_path command identifies specific timing paths as being false. The false timing paths are paths that do not propagate logic level changes. This constraint removes timing requirements on these false paths so that they are not considered during the timing analysis. The path starting points are the input ports or register clock pins, and the path ending points are the register data pins or output ports. This constraint disables setup and hold checking for the specified paths.

The false path information always takes precedence over multiple cycle path information and overrides maximum delay constraints. If more than one object is specified within one -through option, the path can pass through any objects.

You must specify at least one of the -from, -to, or -through arguments for this constraint to be valid.

### **Examples**

The following example specifies all paths from clock pins of the registers in clock domain clk1 to data pins of a specific register in clock domain clk2 as false paths:

set\_false\_path -from [get\_clocks {clk1}] -to reg\_2:D

The following example specifies all paths through the pin U0/U1:Y to be false:

set\_false\_path -through U0/U1:Y

#### See Also

Tcl Command Documentation Conventions Designer Tcl Command Reference

## set\_max\_delay

Tcl command; specifies the maximum delay for the timing paths in the current scenario.

set\_max\_delay delay\_value [-from from\_list] [-to to\_list] [-through through\_list]

## **Arguments**

#### delay\_value

Specifies a floating point number in nanoseconds that represents the required maximum delay value for specified paths.

- If the path starting point is on a sequential device, the tool includes clock skew in the computed delay.
- If the path starting point has an input delay specified, the tool adds that delay value to the path delay.
- If the path ending point is on a sequential device, the tool includes clock skew and library setup time in the computed delay.
- If the ending point has an output delay specified, the tool adds that delay to the path delay.

#### -from from\_list

Specifies a list of timing path starting points. A valid timing starting point is a clock, a primary input, an inout port, or a clock pin of a sequential cell.

#### -to to\_list

Specifies a list of timing path ending points. A valid timing ending point is a clock, a primary output, an inout port, or a data pin of a sequential cell.

-through through\_list

Specifies a list of pins, ports, cells, or nets through which the timing paths must pass.

## **Supported Families**

See the Tcl Commands and Supported Families table for the list of families that support this command.

## **Description**

This command specifies the required maximum delay for timing paths in the current design. The path length for any startpoint in from\_list to any endpoint in to\_list must be less than delay\_value.

The timing engine automatically derives the individual maximum delay targets from clock waveforms and port input or output delays.

The maximum delay constraint is a timing exception. This constraint overrides the default single cycle timing relationship for one or more timing paths. This constraint also overrides a multicycle path constraint.

You must specify at least one of the -from, -to, or -through arguments for this constraint to be valid.

## **Examples**

The following example sets a maximum delay by constraining all paths from ff1a:CLK or ff1b:CLK to ff2e:D with a delay less than 5 ns:

set\_max\_delay 5 -from {ff1a:CLK ff1b:CLK} -to {ff2e:D}

The following example sets a maximum delay by constraining all paths to output ports whose names start by "out" with a delay less than 3.8 ns:

set\_max\_delay 3.8 -to [get\_ports out\*]

#### See Also

set\_min\_delay

SmartTime Timing Constraints Editor User Guide

remove\_max\_delay Tcl Command Documentation Conventions Designer Tcl Command Reference

## set\_multicycle\_path

Tcl command; defines a path that takes multiple clock cycles in the current scenario.

```
set_multicycle_path ncycles [-setup] [-hold] [-from from_list[-through through_list[-to
to_list
```

### Arguments

#### ncycles

Specifies an integer value that represents a number of cycles the data path must have for setup or hold check. The value is relative to the starting point or ending point clock, before data is required at the ending point.

-setup

Optional. Applies the cycle value for the setup check only. This option does not affect the hold check. The default hold check will be applied unless you have specified another set\_multicycle\_path command for the hold value.

-hold

Optional. Applies the cycle value for the hold check only. This option does not affect the setup check.

**Note:** If you do not specify "-setup" or "-hold", the cycle value is applied to the setup check and the default hold check is performed (*ncycles* -1).

-from from\_list

Specifies a list of timing path starting points. A valid timing starting point is a clock, a primary input, an inout port, or a clock pin of a sequential cell.

-through through\_list

Specifies a list of pins or ports through which the multiple cycle paths must pass.

-to to\_list

Specifies a list of timing path ending points. A valid timing ending point is a clock, a primary output, an inout port, or a data pin of a sequential cell.

## **Supported Families**

See the <u>Tcl Commands and Supported Families</u> table for the list of families that support this command.

## **Description**

Setting multiple cycle paths constraint overrides the single cycle timing relationships between sequential elements by specifying the number of cycles that the data path must have for setup or hold checks. If you change the multiplier, it affects both the setup and hold checks.

False path information always takes precedence over multiple cycle path information. A specific maximum delay constraint overrides a general multiple cycle path constraint.

If you specify more than one object within one -through option, the path passes through any of the objects.

You must specify at least one of the -from, -to, or -through arguments for this constraint to be valid.

## **Exceptions**

Multiple priority management is not supported in Microsemi SoC designs. All multiple cycle path constraints are handled with the same priority.

## **Examples**

The following example sets all paths between reg1 and reg2 to 3 cycles for setup check. Hold check is measured at the previous edge of the clock at reg2.

set\_multicycle\_path 3 -from [get\_pins {reg1}] -to [get\_pins {reg2}]

The following example specifies that four cycles are needed for setup check on all paths starting at the registers in the clock domain ck1. Hold check is further specified with two cycles instead of the three cycles that would have been applied otherwise.

set\_multicycle\_path 4 -setup -from [get\_clocks {ckl}]
set\_multicycle\_path 2 -hold -from [get\_clocks {ckl}]

#### See Also

remove\_multicycle\_path <u>Tcl Command Documentation Conventions</u> <u>Designer Tcl Command Reference</u>

## remove\_clock\_groups

This Tcl command removes a clock group by name or by ID.

```
remove_clock_groups [-id id# | -name groupname] \
[-physically_exclusive | -logically_exclusive | -asynchronous]
```

Note: The exclusive flag is not needed when removing a clock group by ID.

## Arguments

-id *id#* 

Specifies the clock group by the ID. -name groupname Specifies the clock group by name (to be always followed by the exclusive flag). [-physically\_exclusive | -logically\_exclusive | - asynchronous]

## **Supported Families**

SmartFusion2, IGLOO2, RTG4, PolarFire

## Example

Removal by group name remove\_clock\_groups -name mygroup3 -physically\_exclusive Removal by goup ID

remove\_clock\_groups -id 12
