

OFF-LINE START-UP CONTROLLER

DESCRIPTION

The SG1540 is an integrated circuit designed to efficiently provide start-up power from a high-voltage DC bus to a PWM control circuit in a switching power supply. When used on the primary side, it reduces start-up current to less than 1mA and allows any standard PWM control circuit to be used as a primary-side controller. When used to power a controller on the secondary side, it efficiently eliminates the need for a heavy 50/60Hz line transformer with its associated low frequency magnetic fields.

The circuit consists of three sections: a micropower bandgap comparator/power switch referenced to 2.5 volts which isolates the start-up capacitor from its load; a high frequency square-wave oscillator with 200mA totem-pole output for driving an isolation transformer; and a second bandgap comparator with latching crowbar to protect against overvoltage faults while starting or running.

The SG1540 is specified for operation over the full military ambient temperature range of -55°C to 125°C. The SG2540 is characterized for the industrial range of -25°C to 85°C, and the SG3540 is designed for the commercial range of 0°C to 70°C.

FEATURES

- Useable with primary and secondary side PWM controllers
- Micropower comparator / switch
 - Internal 2.5V bandgap reference
 - 50mA power switch
- Squarewave oscillator
 - 500Hz to 200KHz operation
 - 200mA totem pole outputs
- Eliminates bulky, expensive 50/60 Hz transformer
- Minimizes high voltage bleeder current
- Programmable start-up voltage and hysteresis
- Internal and programmable overvoltage crowbar latch
- Available in 8 pin DIP, 10 pin flat pack, and 16 pin widebody SOIC

HIGH RELIABILITY FEATURES - SG1540

- ◆ Available to MIL-STD - 883
- ◆ LMI level "S" processing available

BLOCK DIAGRAM

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage (+V _{IN})	+37V
DC Output Current, Continuous (V _{OUT})	100mA
AC Output Current, Continuous	200mA
Analog Inputs (Start and Overvoltage)	-0.3V to 6.0V
Analog Input Currents (V>8V)	10mA
Overvoltage Crowbar Current, Continuous	50mA

Note 1. Values beyond which damage may occur.

Overvoltage Crowbar Energy (½CV²)	8mJ
Operating Junction Temperature	
Hermetic (Y Package)	150°C
Plastic (M, DW Packages)	150°C
Storage Temperature Range	-65°C to 150°C
Lead Temperature (Soldering, 10 Seconds)	300°C
RoHS Peak Package Solder Reflow Temp (40 sec. max. exp.)	260°C (+0, -5)

THERMAL DATA

Y Package:

Thermal Resistance-Junction to Case, θ_{JC}	50°C/W
Thermal Resistance-Junction to Ambient, θ_{JA}	130°C/W

M Package:

Thermal Resistance-Junction to Case, θ_{JC}	60°C/W
Thermal Resistance-Junction to Ambient, θ_{JA}	95°C/W

DW Package:

Thermal Resistance-Junction to Case, θ_{JC}	40°C/W
Thermal Resistance-Junction to Ambient, θ_{JA}	95°C/W

Note A. Junction Temperature Calculation: $T_J = T_A + (P_D \times \theta_{JA})$.

Note B. The above numbers for θ_{JC} are maximums for the limiting thermal resistance of the package in a standard mounting configuration. The θ_{JA} numbers are meant to be guidelines for the thermal performance of the device/pc-board system. All of the above assume no ambient airflow.

RECOMMENDED OPERATING CONDITIONS (Note 2)

Supply Voltage Range	7V to 35V
DC Output Current, Continuous	0 to 50mA
AC Output Current, Continuous	0 to 100 mA
Oscillator Frequency Range	1KHz to 400KHz
Timing Resistor Range	2K Ω to 150K Ω

Note 2. Range over which the device is functional.

Timing Capacitor Range	1nF to 20 μ F
Operating Ambient Temperature Range	
SG1540	-55°C to 125°C
SG2540	-25°C to 85°C
SG3540	0°C to 70°C

ELECTRICAL CHARACTERISTICS

(Unless otherwise specified, these specifications apply over the operating ambient temperatures for SG1540 with -55°C ≤ T_A ≤ 125°C, SG2540 with -25°C ≤ T_A ≤ 85°C, SG3540 with 0°C ≤ T_A ≤ 70°C, and +V_{IN} = 15V. A 0.1 μ F high frequency bypass capacitor is recommended on V_{IN}. Low duty cycle testing techniques are used which maintains junction and case temperatures equal to the ambient temperature.)

Parameter	Test Conditions	SG1540/2540/3540			Units
		Min.	Typ.	Max.	
Start-up Section					
Start Current I _{CC}	V _{START} = 0 to 2.37V		0.2	0.4	mA
Operating Current	V _{TIMING} = +V _{IN} ; V _{OUT} Open		0.3	0.6	mA
	F _{OSC} = 50KHz, V _{OUT} and AC _{OUT} Open		3	6	mA
Start Threshold		2.37	2.50	2.63	V
Start Bias Current	V _{PIN 1} = 0 to 5V		0.1	1	μA
Start Clamp Voltage	I _{PIN 1} = 1mA	6	7	8	V
Hysteresis ON Voltage	I _{PIN 4} = 100μA		0.1	0.2	V
DC Output Section					
V _{OUT} Voltage	I _{SOURCE} = 10mA	12.5	13.5		V
	I _{SOURCE} = 50mA	12.0	13.0		V
Short Circuit Current	V _{OUT} = 0V	50	100	225	mA

ELECTRICAL CHARACTERISTICS (continued)

Parameter	Test Conditions	SG1540/2540/3540			Units
		Min.	Typ.	Max.	
Oscillator Section (Note 3)					
Initial Accuracy	T _J = 25°C	46	50	54	KHz
Voltage Stability	+V _{IN} = 12 to 18V		5	12	%
Temperature Stability (Note 4)			2	5	%
Oscillator Minimum Frequency	R _T = 17.8K, C _T = .068μF			1	KHz
Oscillator Maximum Frequency	R _T = 1.5K, C _T = 470pF	400			KHz
AC Output Section					
HIGH Output Voltage	I _{SOURCE} = 20mA	12.5	13.5		V
	I _{SOURCE} = 100mA	12.0	13.0		V
LOW Output Voltage	I _{SINK} = 20mA		0.2	0.3	V
	I _{SINK} = 100mA		1.2	2.0	V
Squarewave Duty Cycle		45	50	55	%
AC Output Risetime	C _L = 1000pF		0.3	0.6	μS
AC Output Falltime	C _L = 1000pF		0.1	0.2	μS
Overvoltage Crowbar Section					
Overvoltage Threshold		2.37	2.50	2.63	V
Overvoltage Bias Current	V _{O.V.} = 0 to 2.37V		0.1	1	μA
Overvoltage Clamp Voltage	I _{O.V.} = 1mA	6	7	8	V
+V _{IN} Overvoltage Threshold		37	42	44	V
SCR ON Voltage	I _{VIN} = 35mA		9	12	V
SCR Holding Current	V _{O.V.} = 0	0.15	0.35	0.55	mA

Note 3. $F_{OSC} = 50\text{KHz}$, $R_T = 3.48\text{K}$, $C_T = 4.7\text{nF}$ unless otherwise specified.

Note 4. These parameters, although guaranteed, are not tested in production.

APPLICATION INFORMATION

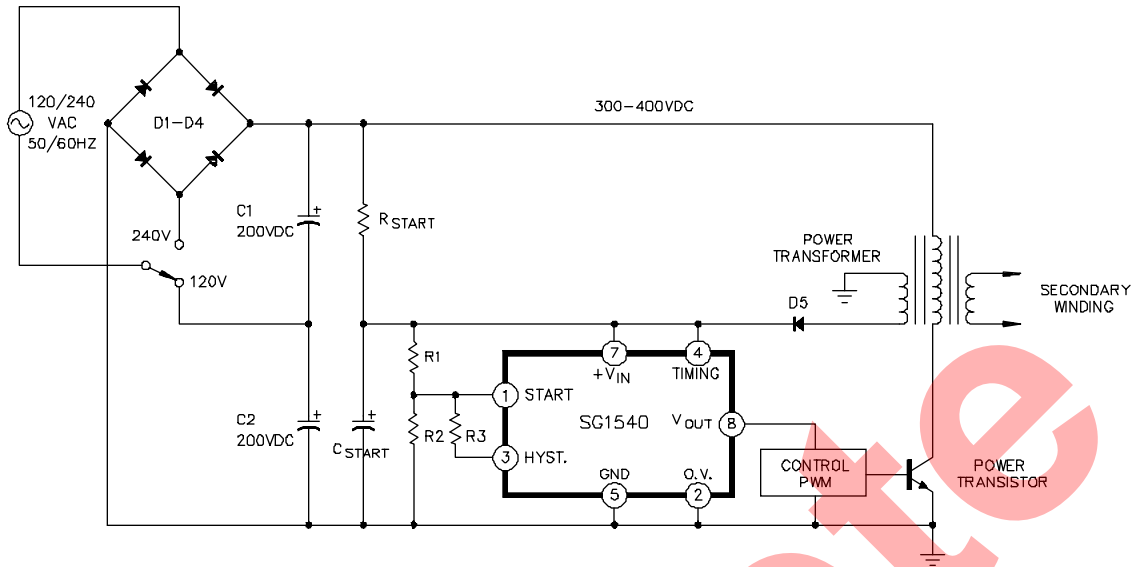

FIGURE 3 - EFFICIENT PRIMARY SIDE START-UP

PRIMARY SIDE START-UP

When the design goal is efficient start-up for a control PWM referenced to the primary side of the power transformer, the configuration in Figure 3 is recommended. An energy storage capacitor C_{START} is trickle-charged from the 300-400 Volt DC bus by resistor R_{START} . The value of R_{START} is chosen to provide a constant 1mA charging current, allowing the use of a ½ watt resistor. As the voltage on C_{START} ramps up from zero, the only load current is the standby current of the SG1540 and that of the divider network R1-R3. (Connecting the TIMING pin to $+V_{IN}$ disables the internal power oscillator and forces the circuitry into a micropower standby model. Since the input bias current at the START pin is 1µA maximum, a divider current of 100µA is adequate).

When the voltage at the START pin reaches +2.5 Volts, the hysteresis transistor turns off, overdriving the START pin. The V_{OUT} pin is switched to the HIGH state, providing power to the PWM control circuit. As energy flows out of the START capacitor, its voltage decays; but it remains connected to the PWM circuit until the dropout voltage is reached ($V_{START} - V_{HYSTERESIS}$). The bootstrap winding on the power transformer and rectifier diode D5 prevent this from happening. As the PWM control circuit becomes active, the power transistor begins to switch, providing operating current to the PWM circuit through the SG1540.

RESISTOR CALCULATIONS

Given that V_{START} and $V_{DROPOUT}$ have been chosen, and that the divider current at start-up is 100µA, then the values for R1 through R3 are calculated as follows:

$$1. \text{ For simplification, let } X = \frac{V_{START} - 2.5}{2.5} \quad [1]$$

$$2. \text{ Then, } R1 = 2.5 \times 10^4 * X \quad [2]$$

$$R2 = R1/Y$$

$$\text{and } Y = \frac{V_{DROPOUT} - 2.5}{2.5} \quad [3]$$

$$\text{and } R3 = \frac{R1 * R2}{X * R2 - R1}$$

DESIGN EXAMPLE

Suppose we have a power MOSFET device, and so want to start at +18 volts and drop out at +12 volts.

$$\text{Then } X = 6.20$$

$$\text{and } Y = 3.80$$

$$\text{Therefore } R1 = 2.5 \times 10^4 * 6.2 = 155K \quad (\text{Choose } 150K)$$

$$R2 = 1.5 \times 10^5 / 3.8 = 39.5K \quad (\text{Choose } 39K)$$

$$R3 = \frac{1.5 \times 10^5 * 3.9 \times 10^4}{6.2 * 3.9 \times 10^4 - 1.5 \times 10^5} = 63.7K \quad (\text{Choose } 62K)$$

APPLICATIONS INFORMATION (continued)

The voltage waveform at $+V_{IN}$ is shown in Figure 4 with these resistor values and with $C_{START} = 3\mu F$. Notice that two tries are required before the +15 volt bootstrap winding becomes active.
