

Features

Inputs/Outputs

- Accepts two differential or single-ended inputs
 - LVPECL, LVDS, CML, HCSL, LVCMOS
 - Glitch-free switching of references
- On-chip input termination and biasing for AC coupled inputs
- Eight precision LVDS outputs
- Operating frequency up to 750 MHz

Power

- Option for 2.5 V or 3.3 V power supply
- Current consumption of 114 mA
- On-chip Low Drop Out (LDO) Regulator for superior power supply rejection

Performance

- Ultra low additive jitter of 165 fs RMS

Ordering Information

ZL40223LDG1	32 Pin QFN	Trays
ZL40223LDF1	32 Pin QFN Matte Tin	Tape and Reel
Package size: 5 x 5 mm -40°C to +85°C		

Applications

- General purpose clock distribution
- Low jitter clock trees
- Logic translation
- Clock and data signal restoration
- Redundant clock distribution
- Wired communications: OTN, SONET/SDH, GE, 10 GE, FC and 10G FC
- PCI Express generation 1/2/3 clock distribution
- Wireless communications
- High performance microprocessor clock distribution

Change Summary

Below are the changes from the February 2013 issue to the April 2014 issue:

Page	Item	Change
1	Applications	Added PCI Express clock distribution.
6	Pin Description	Added exposed pad to Pin Description.
8, 9	Figure 5 and Figure 6	Removed 22 Ohm series resistors from Figure 5 and 6. These resistors are not required; however there is no impact to performance if the resistors are included.

3.0 Functional Description

The ZL40223 is an LVDS clock fanout buffer with eight output clock drivers capable of operating at frequencies up to 750 MHz.

The ZL40223 provides an internal input termination network for DC and AC coupled inputs; optional input biasing for AC coupled inputs is also provided. The ZL40223 can accept DC coupled LVPECL or LVDS and AC coupled LVPECL and LVDS input signals, AC coupled CML or HCSL input signals, and single ended signals. A pin compatible device with external termination is also available.

The ZL40223 is designed to fan out low-jitter reference clocks for wired or optical communications applications while adding minimal jitter to the clock signal. An internal linear power supply regulator and bulk capacitors minimize additive jitter due to power supply noise. The device operates from 2.5V \pm 5% or 3.3V \pm 5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

The device block diagram is shown in Figure 1; its operation is described in the following sections.

3.1 Clock Inputs

The device has a differential input equipped with two on-chip 50 Ohm termination resistors arranged in series with a center tap. The input can accept many differential and single-ended signals with AC or DC coupling as appropriate. A control pin is available to enable internal biasing for AC coupled inputs. A block diagram of the input stage is in Figure 3.

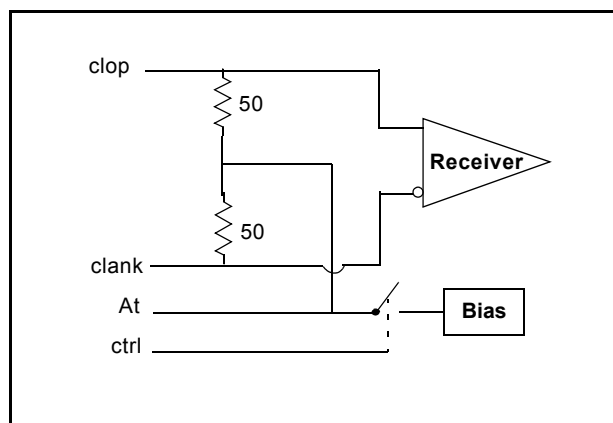

Figure 3 - Simplified Diagram of Input Stage

3.1.1 Clock Input Selection

The select line chooses which input clock is routed to the outputs.

Sel	Active Input
0	clk0
1	clk1

Table 1 - Input Selection

The following figure shows the expected clock switching performance. The output stops at the first falling edge of the initial clock after the select pin changes state. During switching there will be a short time when the output clock is not toggling. After this delay, the output will start toggling again with a rising edge of the newly selected clock. This behavior is independent of the frequencies of the input clocks. For instance, the two clocks could be at different frequencies and the behavior would still be consistent with this figure.

3.2 Clock Outputs

LVDS has lower signal swing than LVPECL which results in a low power consumption. A simplified diagram for the LVDS output stage is shown in Figure 13.

Figure 13 - Simplified LVDS Output Driver

The methods to terminate the ZL40223 drivers are shown in the following figures.

3.3 Device Additive Jitter

The ZL40223 clock fanout buffer is not intended to filter clock jitter. The jitter performance of this type of device is characterized by its additive jitter. Additive jitter is the jitter the device would add to a hypothetical jitter-free clock as it passes through the device. The additive jitter of the ZL40223 is random and as such it is not correlated to the jitter of the input clock signal.

The square of the resultant random RMS jitter at the output of the ZL40223 is equal to the sum of the squares of the various random RMS jitter sources including: input clock jitter; additive jitter of the buffer; and additive jitter due to power supply noise. There may be additional deterministic jitter sources, but they are not shown in Figure 18.

Figure 18 - Additive Jitter

3.4 Power Supply

This device operates with either a 2.5V supply or 3.3V supply.

3.4.1 Sensitivity to power supply noise

Power supply noise from sources such as switching power supplies and high-power digital components such as FPGAs can induce additive jitter on clock buffer outputs. The ZL40223 is equipped with a low drop out (LDO) linear power regulator and on-chip bulk capacitors to minimize additive jitter due to power supply noise. The on-chip regulation, recommended power supply filtering, and good PCB layout all work together to minimize the additive jitter from power supply noise.

3.4.2 Power supply filtering

For optimal jitter performance, the ZL40223 should be isolated from the power planes connected to its power supply pins as shown in Figure 19.

- 10 μF capacitors should be size 0603 or size 0805 X5R or X7R ceramic, 6.3 V minimum rating
- 0.1 μF capacitors should be size 0402 X5R ceramic, 6.3 V minimum rating
- Capacitors should be placed next to the connected device power pins

Figure 19 - Decoupling Connections for Power Pins

3.4.3 PCB layout considerations

The power supply filtering shown in Figure 19 can be implemented either as a plane island, or as a routed power topology with equal effect.
